Alan,

Could you elaborate? The BC9000XLT has one pair of registers
to hold frequency limits for Search and Auto Store operations.

If you mean Monitor memory, as in the Radio Shack models,
the BC9000XLT and BC3000XLT have the SND (send) key which
can be used to store a frequency found during a search,
permitting *any* memory bank to be used as a Monitor bank.

Yes, folks.

Fidonet just took its monthly shit on us.

Here is an account:

Newsgroups:
news.admin.net-abuse.announce,news.admin.net-abuse.misc,alt.retromod,alt.nocem.misc
Date: Sat, 27 May 1995 16:31:33 GMT
From: red@redpoll.mrfs.oh.us (Richard E. Depew)
Subject: spewcancel:553:nisc.fidonet.org:rec.radio.scanner
Organization: ARMM Removal Services

A broken gateway at nisc.fidonet.org has spewed 553 recycled articles
into rec.radio.scanner with new headers. I've issued cancels for them,
based on the following selection criteria (which are more compact than
the NoCem list that follows):
HISTORY=@nisc.fidonet.org
NEWSGROUPS=rec.radio.scanner
DOUBLED=Message-ID:

The "<cancel.", "cyberspam!spamcancel!", and "X-Canceled-By: "
conventions were followed for approximately the first half of the cancels
until I noticed the pilot error. :-) The second half of the cancels
used the proper "cyberspam!spewcancel!". Sorry 'bout that!

This spew seems to have been a single bolus of classic Fido-Net poop.

Here are the message-ids of the canceled messages in a format that may
or may not be helpful to NoCem users. Oh, I don't have PGP set up on
this machine.

What would I do? Nothing. Ignoring for the moment the (IMHO absurd)
ECPA, the Communications Act of 1934 prohibits divulging the contents of
anything other than a broadcast, amateur transmission or transmission
by a ship in distress except "in response to a subpeona issued by a
court of competent jurisdiction" or "on demand of other lawful
authority." (There are other exceptions which don't apply here.)
So you are breaking the law if you divulge the contents of the call
you intercepted.

What would I do if, for example, the conversation were about a murder
plot rather than drug smuggling? Probably something. But I wouldn't
break a law I think is important (the Communications Act) to try to
help enforce our well-intentioned but ineffective drug laws.

Bob,

I mean search banks. The BC9000 has one. The Radio Shack 20035 has ten.
The AR8000 has TWENTY. I have more use for permanent search ranges; I
don't want to have to do a new search and store every time I want to see
what's on certain bands.

Cheers,
Alan

Easy. Call the police but don't leave your name/number!

As for listening to cell phones -- who cares? Why should anyone have any expectation of privacy especially over radio waves? Hmm.. why don't we just have the government make it illegal to breathe -- I imagine they can make a bundle off of that!

Sorry, but radio waves belong to everyone. Government is about policy not about ownership...

3978. Disaster Drill in N.J.

Newsgroup: rec.radio.scanner
Date: 1995-05-27 00:00:00 UTC
From: gazerz@aol.com
Message-ID: <3q8dou$fj7@newsbf02.news.aol.com>
Source record: 255759

There will be a Disaster Drill in Central/South Jersey (Burlington County)next weekend .If anyone would like, I'll post some of the freq's I have for this drill.

Below is E-Mail I received from a friend who lives down there.

Guys:

I received an inquiry from Gazerz about the June 3rd disaster drill of the simulated airliner crash with a military jet over Burlington County, NJ. Gazerz asked if I would be there? Some Freqs and how and where to get there.
So, I thought I would e-mail my answer to all of you in case you are interested in monitoring it.

Burlington County is above Camden County from me. It is on the fringe of my
monitoring coverage area. I will be monitoring the drill, but from home, and
will assume it will begin around 8 AM although it might be later in the day.
This is an excellent way to verify those frequencies that would come into play in the real thing. With the leaves on the trees, most of the signals won't make it here. Also, the drill site is on the Atlantic Ocean side of Burlington County instead of being nearer to me on the Delaware River side of
the county.

Burlington County covers some ground, it runs from the Delaware River to just
before the Atlantic Ocean, so it spans the entire state west to east. It includes Ft. Dix and McGuire AFB, the Lakehurst Naval Air Station and the huge Wharton State Forest.

We know that two aircraft fuselages have been rented for the ocassion and will be dropped somewhere and have to be "found."

Volunteer "casualties" will have to be found and will be made-up with "phony"
injuries, etc. So, you'll have Search & Rescue teams and ambulances and probably National Transportation Safety Board?

To narrow things down just a bit, the news release stated:

"The passenger jet will crash near Lake Oswego and passengers will have been
assumed to have fallen in the lake." [This lake is a very tiny place near
Jenkins, south of Penn State Forest off route 563.]

"The military jet, trying to return to McGuire AFB, will crash in Lebanon
State Forest and trigger a raging forest fire." [Lebanon State Forest is due
north of the Lake Oswego crash site, just south of the Fort Dix Military
Reservation.]

This entire simulation will take place in the County of Burlington, off the
N. J. Turnpike at exits 4 and/or 5. Or, come down U. S. Rte. 206 and you'll
be right in the heart of things. Be sure to have a good N. J. road map,
however and your copy of Police Call for New Jersey.

This is going to be so big, that I just have to be home to monitor things and
make notes, etc. It's just a shame that it will be just outside of my
monitoring area for much of the "on scene" stuff.

As far as frequencies go, it's just too big an event spread over too big a
part of the state, to tie me down to frequencies. Potentially, hundreds of
frequencies may be used!! Honest! The newspaper item says, "We'll have the
fire, EMS, police and state police there. The prosecutor's office will play
and the medical examiner will play. Everyone is going to be playing, said
Bill Rowley, Burlington County's emergency management coordinator."

"Four hospitals will be participating in the Burlington Co. exercise,
including West Jersey." [I'll have to look at the maps to get a guess on
which three other hospitals will be used.]

So, the above is what we know from the newspaper clipping.

Can we expect Civil Patrol SAR planes in the air? How about the area medevac
helicopters for SAR? And the State Police helicopters? Will the military
take part? Those from Ft. Dix, McGuire, etc? If they plan a "raging forest
fire" will the forestry service play a part in the drill? Mock evacuations?
Which and how many fire departments will take part? News media choppers?
What will the frequency be for the on-scene Communications Center? How about
a triage point? State Police dive teams may be searching in Lake Oswego for
"victims."

This drill is located in the deep woods, with few roads and small fire companies and few ambulance services.

I'll do some further research and get back to you all with some frequencies,
etc. that I "feel" might be used.

I'd like to invite you here for the drill except for two reasons, we'd probably spend the time with B. S. instead of the drill and second, it is just a bit to far from here to really bring in a lot of the action. But, I'll sure try to hear things and let you know by e-mail during the day of the
drill. I will program my new BC9000 with Burlington County frequencies this
weekend and see if I get any better reception, I'll let you know.

If you are not interested in further details, please e-mail me that fact.

From: ryder@andrews.edu
Message-ID: <3q862n$5p1@orion.cc.andrews.edu>
Source record: 255761

Does anyone have any opinions on the Bearcat 220 XLT? I heard it had problems with imaging. Is that true? How bad?

Just by looking at the specs, it looks like a good radio, and I've seen it for around $208.

Is it possible to restore cellular on it?

Thanks for any and all info,

Rich

S> Funny.....I thought this forum was here to exchange information. I guess
S> I was mistaken and should look elsewhere!

Without any quote from a message you are answering, it's kinda hard to understand what your complaint it. This *IS* a firum roe the exchange of information.
Frequencies? They are easy to get. (The message header has (HOW TO OBTAIN FREQUENC in it, so I kinda thought that may be what you are looking for.) POLICE CALL, avaliable at almost any Radio Shack (also GROVE, and several other mail order houses) is a great start. BEYOND POLICE CALL, available at the same places, is another source for frequencies. There are also other frequency guides availble from various sources; try a copy of Monitoring Times or Popular Communications for ads for these. Each of these magazines is also a source for frequencies.
The RCMA is another source. (Write them at:
RCMA
P.O. Box 542
Silverado, Ca. 92676
Their SCANNER JOURNAL is a monthly source of public safety and other frequencies, and news.

Of course, some who ask for all the frequencies for, say, Southern Ca. will not get far, as the sheer number of active frequencies precludes them being posted here.
If the freqs for, say, a certain city that has just gone trunked are asked for (they probably won't be in POLICE CALL yet), they are usually posted no problems.
Can I help any more?

Very simple. They write the rules, then take away all the money from those they find breaking the rules.
Oh, you meant "where do they get the authority for doing this?" Well, that's another question, altogether. They get it from those of us who don't complain, and continue to vote in those congresscritters who continue to give us the shaft. It's the American Way.

That was a WARTHOG, or A-10. Close, real close, but no cigar.
95x? If this is nine hundred and fifty-something megahertz, it doesn't
compute. Now, 960 to 1215 would put it in aeronautical Navigation;
maybe this was a navigation radio? I'm no expert, but the F-16 has several
radios, including at least: 2 nav radios, and two comm radios, and probably
a few more to keep the cost up there ;-).

There have already been several cases of this type, at least one here on Long Island. The fact is, the Constitution only protects against illegal search and seizure by the government. If you are not a law enforcement officer, the evidence would be perfectly admissable in Court. In fact, you could break into your neighbors house, find contraband, and give it to the Police. It would be admissable, as long as the plice did not ask you to do the break in. Of course, you could be charge with Burglary.
In the cas of cell phone calls, the DA would probably grant you immunity, as he would need your testimony to establish probable cause for the ensuing police action.
The answer is, if you hear planning or evidence of what you believe would be a major crime (murder, rape, major drug transaction), go ahead and call the authorities.

Source record: 255772

Does anyone know about the law and scanners in New Zealand. I thought that you could listen to anything you wanted as long as you didn't relay the information.

I was recently stopped at a breath testing checkpoint here in Christchurch, the police officer saw a scanner and asked did I listen to the police? (of course I do!) I said that I suppose I could, they said if I did they could confiscate the equipment!

This sounds like bs to me, does anyone know for sure?

Cheers
Nathan

I've constructed a number of 1/4wave groundplanes on 2meters. I almost
always used #12 or #14 copper (non-stranded) wire, very successfully.
I don't think having a larger diameter makes much difference, unless
it's a MUCH larger diameter (say copper water pipe). I've seen this
used successfully, but the different in portability of the antenna has
always turned me off to this solution.

You might try making a 1/4wave and seeing how it works. For me, this
is the simplest antenna I can make which guarantees a good (even great)
match across a wide frequency range. It also has a base impedence of
about 50 ohms, which is certainly convenient. (I typically use an
SO-239 connector as the 'base' of the antenna, and solder wires to
the center spike for the driven element and the four mounting
holes for the ground plane).

Best regards,
-jcp- (N3CKF)

> Newsgroups: rec.radio.scanner,alt.radio.scanner
>
> Hi! Would you please tell me what "reaction tuning" is?
> (I have an ar8000)

The term "reaction tuning" refers to the capability to automatically tune a receiver (within 8 mS) to the current frequency received by the OEI Scout 40. This can be done with receivers such as Icom's R7000, R7100, R9000 (through the CI-V interface); Realistic's PRO-2005, PRO-2006 (with an appropriate interface); and AOR's AR8000 (with an appropriate interface cable). The idea is that with this combo you could just walk by an area and instantly pickup their signal without searching and keying in frequencies. The Scout will automatically find and record frequencies from 10MHz through 1400MHz (1.4GHz).

The appropriate interface cable we provide for using the Scout with the AR8000 depends upon the version of the Scout you will be using.

If you own a GPS receiver you can see the amount of sattelite
degredation by looking at the PDOP figure on the display. Lately I have
seen it change up and down. Nevertheless, I have seen the amount of
degredation change with the political tide. In fact with DGPS it a moot
point, but even with the degreadation, it will only degrade to about
100m of distance accuracy. I have found that the altirude readout
suffers more from the degredation than does the distance.

At the risk of fanning flames...

There are appropriate areas to post commercial announcements. This is a
moderated forum, so the announcement passed whatever criteria the moderator
uses. I didn't find it objectionable since it is short.

I'm looking for a first scanner for myself, and am looking for something that is really cheap. (Seen perhaps in the range of <USD$50-$100).

If you might have something that is gathering dust, that you might like to help someone get into the hobby, send me an email at "s2202629@np.ac.sg" (my newsfeed is pretty broken, and won't be able to receive followups.

Would like to know the condition of the unit + coverage + how much you might like for the unit.

Thanks.

Howard Bornsteins "Guide to the AR1000" would have quite a bit of
relevant information regarding how to "drive" the 1500. Both the AR1500
and 1000 work the same way. The only major difference is the Auto Store
that you have isn't on the 1000 and the BFO wouldn't be mentioned either.

You might find a local radio dealer sells it - might be worth a look if
nothing else.

Its in the back of the manual (or should be). It is used when you do a
hard keyboard reset of the CPU. Has no other use.

>The trident stuff looks an awful lot like the AOR radios under another name

That's because they are. The Trident radio are manufactured by Nissei
Electronics, who make many of the AOR handhelds.

When ACE Communications lost AOR distributorship in the US, they imported
them under a different name. Note that they do not have an equivalent for
the AR8000, which is not manufactured by Nissei.

Message-ID: <jwaydaD99rLo.E5z@netcom.com>
Date: Sun, 28 May 1995 03:41:48 GMT

The Icom R1 should NOT be considered a primary scanner due to severe overloading and intermod problems. I bought an R1 about a year ago and returned it after a 30 day trial period and bought a RS PRO-43. The PRO-43 is a much better scanner for about $250.00 less. The attraction of the R1 is it's concealability. If you can buy a used R1 for less than $200.00, it is probably a good deal. If you must have HF coverage, then consider the YUPI 7100 or AOR 8000. If you just want a good scnner consider the Bearcat BC3000XLT or a used RAdio Shack PRO-43.

Please excuse the fonetic spelling. I am a design engineer, not an english major!

Hello Anybody,

Am looking for folks who have the Yupi (not AOR) 8000.
Got some questions and would like to exchange info.

E-mail or here.

Thanks, Dave

Steve Donnell published some 8500XLT modifications in National Scanning.

Here are some previous postings on the BC8500XLT. Note many
of these comments are a few years old:

| Date: Thu, 30 Sep 93 14:00:02 EDT
| From: Think Summer <brown@mkots3.enet.dec.com>
|
| The 8500 XLT is pretty decent, sensitivity seems to be on a par with the
| PRO-2004/5/6 series.....
|
| The radio does generate quite a bit of EMI from its control logic,
| and this is quite apparent if you use the back-of-the-set antenna,
| but is not a problem with an outdoor antenna.
|
| The alphanumeric dot matrix display is a nice feature, and makes for
| easier display intelligibility than the usual 7-segment type display.
|
| My main gripe is that the modes are fixed for the various band segments,
| and that there are not more tuning/search increments available. These
| increments are 5, 12.5, 25 and 50 KHz (maybe 30 KHz on restored cellular?).
|
| Also, a computer interface would have been a real nice addition.....
| A quick checkout using my Wavetek 3010 sig gen shows it ti have about
| 0.5 uV sensitivity for NBFM, about 1 uV for AM and 3 uV for WBFM.
| The antenna connector is a BNC. Power is 13.8 VDC, either from a car
| battery or the included "wall wart" which is tha same unit that powers
| the BC760XLT and others.
|
| Most of the programming and use is intuitively obvious, just one quick
| pass thru the well written user's manual should suffice, it isn't as
| user-hostile as the Shinwa or J.I.L (have that on your list ?) scanners
| are. The alphanumeric channel labelling works very much like an electronic
| version of the old DYMO label maker. It allows upper and lower case letters,

| numerals and the more common punctuations....
|
|
| Overall, I'd rate the 8500 fairly high, almost a "poor man's R7000".
|
|
| ed
|
|
| Sb: #BC8500XLT A*W*F*U*L !!!
| Fm: Jeff Goldman 76703,4224
| To: All
|
| And you thought I never met a scanner I didn't like. <g>
|
| This one takes the cake. First the good news. It's pretty. Now the bad news.
| Sensitivity is beyond merely bad and into the realm of unbelievably bad.
| There's no attenuator button that I may have hit by mistake either. And the
| audio quality is no where near the high fidelity audio from the BC890XLT,
| though it uses the same speaker.
|
| As for features, yes it is loaded with them, including Alpha and other
| goodies, BUT NO Wx Search or Alert!
|
| And, just to make matters worse, they DID change the PL board. The BC005 is
| totally different than the earlier BC002 board, though the PL freqs are
| identical. Grove does NOT have the new board in stock yet.
|
| I looked inside the scanner and there's no obvious cell mod. Guess we'll hav
e
| to wait for word on that. Memory backup is probably EEPROM, vs the over-5 yr
| lithium cell used in the BC890XLT.
|
| Datecode is OGIC, or July, 1993.
|
| I can't get rid of this thing fast enough. Yeah, I'll have to eat the cost o
f
| receiving it overnight from Grove, but that's ok. Live and learn.

| Fm: Don McVey KK6TD 70541,634
| To: Jeff Goldman 76703,4224 (X)
|
| Hi Jeff - I am pretty sure that you got a defective unit. I spent about 45
| minutes today comparing the 8500 side-by-side with a 2006 at Scanners
| Unlimited. Weak signal reception seemed very comparable. In fact, after th
e
| Bearcat warmed up a bit, it seemed in some areas to be even more sensitive
| than the Pro 2006.

|
| It was interesting, though, that when I started the comparison I had to slow
| the 8500 down to 20 cps to match the 2006 performance on weak signals. Once
| it had been on about 5 min it was equal to (better?) than the 2006. It
| consistently stopped on the same weak signals the 2006 did, and in the AM
| aircraft range actually did better. However, I agree with your comment on t
he
| audio. There is more white noise on the 8500 than on the 890, or the 2006.
| It really needs some high end filtering of some sort. Its not terrible, but
| it could be better. Until someone puts a service monitor on the thing, we
| really won't have the last word on sensitivity :).
|
| IMHO, with all the features, especially the alpha display, it is a viable
| contender to the 2006. I may seriously consider it for a base unit. There
is
| still no news on the mod, but I understand Grove is tearing into one now.
| Seems there is a large metal cover over much of the inards (as you already
| know!) Did you look under it to see what was there? I'm not into the 800MH
z
| stuff, but I am curious about the design.
|
| Regards, Don

| Sb: #8500 XLT Review
| Fm: DANIEL 71242,1774
| To: ALL
|
| Well, I finally received the much heralded 8500 XLT on Friday, 9/10, from
| GROVE who does have them in stock.. This unit is a base scanner with 500
| channel capability. It is larger than the Pro-2006, however, also lighter.
| The 8500 will invariably be compared to the Pro-2006 as a base scanner, and
a
| base scanner it is! You cab use it mobile, but IMHO, it is just too large...
| The radio has a lot of new bells and whistles that the Pro-2006 does not hav
e.
| It will also scan at an astounding 100 CPS. I like the large display, and th
e
| alpha-numeric feature. The unit will also auto store searched frequencies,
| and auto sort programmed frequencies, without effecting the program set up i
n
| the channels. It has auto record capabilites, and a memory counter to log t
he
| amount of times a transmission is detected on a specific freq., also a usefu
l
| feature. I LOVE the fact that this unit has CTCSS capabilties with 500
| channels. I have found when you start "toning" out frequencies, you tend to
| use more bank space. This was the case with my 760XLT and only 100 channels
.
| You can use the VFO knob to move channels OR frequencies up and down. Its
| REAL smooth, and a nice feature. Everythign functions well and logically on

| the front panel. You have plenty of room to press the buttons, and they are
| large enough to see and use easily. The down side of this is the large size
of
| the radio. Functionally, in my preliminary side by side test with a Pro-2006
,
| same antenna, the radio was just as sensitive, and at times more sensitive
| than my Pro-2006. My Pro-2006 was also peak tuned by Bill Cheek..... Now I'l
l
| tell you what I didn't like.... Depite mag and catalog listings, the 8500 DO
ES
| NOT have a weather button, OT weather alert. I don't know why they put it o
n
| the 890 XLT, and not on this one. (excuse the typo, that was no button OR
| alert). The audio quality of the 8500 is tinny, and the white noise on fring
e
| stations is louder than the Pro-2006. The audio quality of the Pro-2006 is
| far superior to the 8500 XLT. Hopefully there is a mod to correct this.. Th
e
| audio quality is not intolerable, however, just different.. They changed the
| tone board for the 8500 XLT to the BC005. You cannot use the one from your
| 760 or 890 XLT. Grove is backordered and didn't even know of the change unt
il
| Friday, 9/10 when I told them.... No known mod as of yet.... I have only had
| the unit running for about 2 hours, and not had the chance to really delve
| into features, etc... As I progress, will post my comments here. Overall, a
| serious contender to the Pro-2006, but if I had to choose between the two, a
nd
| could only afford one, it would still be the Pro-2006. I am seriously leanin
g
| toward keeping this one, however, because of the CTCSS capabilities, the
| alpha-numeric, and some other features... Dan

| From att!mkots3.enet.dec.com!brown Fri Oct 1 08:04:26 1993
|
| ......
| The manual is well-written in the sense that it is actually readable English
| rather than in the usual "pidgin" as I've seen with some units, notably Azde
n.
|
|
| I'd give the PRO-2006 the higher marks as far as overall construction, and
| usefulness, in that the modes are selectable. The 8500 scans faster (up to
| 100 chann/sec) has the alphanumeric display, has the search and store, event
| per channel counter, CTCSS option, and channel selectable tape recorder
| activition output. The two things they both lack, are an S-meter and a
| computer port. These can be added by the user, but they end up being kinda
| "klugey".
|

|
| So I bought a Unidex 8500XLT scanner. I like it a lot: the alpha display
| of frequencies is cool; notifying of frequency conflicts,
| auto store, auto sort and the ability to move exisitng frequencies (and
| their names) to another bank is great. But, two things really bug me:
|
| * There is a fair amount of hiss in the background. Apparently, this is a
| known problem with a leaky capacitor and will be fixed in later production
| runs.
|
| * The Squelch "tail" (the amount of lag time after a transmission stops and
| the squelch kicks in) is a bit long and annoying. Long enough that you get
| a fair amount of open static and that familiar 'pop' before the squelch
| mutes. Much longer than my Fairmate HP-100 (i.e. AOR 1000). The Fairmate
| mutes almost immediately and there is no pop. I think its spoiled me. Are
| all Unidens this way? Turning up the squelch had little effect.
|
| Now maybe the excess noise on the tail is caused by this leaky cap, I don't
| know. Also, some have said that the particular sound quality of the 8500
| may attribute to the degree of annoyance of the pop. In either case, I
| think it's the length of the pop that's the problem.
|
| I'm wondering if anyone else has noticed this and if there is a solution to
| fixing it. For instance, is their a cap or resistor inside that adjusts
| the squelch tail time? Or is this just the way things be with Bearcats and
| I should just live with it (or return it and go back to the Fairmate).
|
| Thanks!

|
| The 8500XLT has some problems. It's loaded with background hiss and its
| squelch tail is one of the most annoying out there. Other than that it's

| not bad. ;)
|
| Cellular is locked out and there is no known mod at this time. Though you
| can pick up images above 1264 with it quite well (I thought this was
| supposed to be a triple conversion receiver??).
|
| I haven't found the sensitivity to be wanting (about the same as my
| Fairmate HP-100), though a few have said the units they got were lame in
| this area. The alpha naming and turbo scan are quite cool.
|
| Supposedly there is a fix already known for the hiss (bad capacitor or
| something). I'm waiting to hear from Uniden on that. You should really
| check one out before you buy one. Better yet wait a while and see if
| Uniden fixes the problems. Or check out an 890XLT instead.

lmarva.com writes:
| > Does anyone know where, or how I can get mods for a BC8500-XLT to resto
re 800 MHZ ?
|
| I don't believe it's necessary, as I heard lots of cellular activity in
| the 1.2 to 1.3 GHz range. This radio has terrible problems with images.
| Even images at the 455 kHz IF! I returned mine for a refund.
|
| By the way, the alpha display only works for half the channels (the first
| 250). Mine radiated badly, necessitating use of an external antenna rather
| than the supplied whip. Then I needed an attenuator to reduce overloading,
| which was only partially successful.
|
| Sorry to dump on your new radio, but others may avoid learning the hard
| way of its deficiencies. Perhaps in a rural environment without pagers
| it might work OK!

| Bob,
|
| I was looking thru the December '93 issue of Monitoring Times, and I ran
| across an article entitled, "Uniden Enhances BC2500XLT and BC8500XLT
| Scanners." It seems they have corrected some of the problems that you
| heard about on the 8500. On the 8500 they modified the sound quality,
| adding more bass, and signal-to-noise improvements have increased sens-
| itivity in both models; there has been no improvement, however, in
| dynamic range (overload "intermod"). The 2500's memory keepalive current
| has been reduced by 75%, so the battery's charge lasts longer.

Why hasn't anyone considered the obvious answer - an
anonymous tip to DEA? Even without "probable cause", they
can still place the affected area under surveillance and
bust whoever commits an unlawful act there.

Can you do this with the AOR2700 (UK spec) too ? I believe the interface to
be similar, but not quite identical, to the AOR8000.

Are there any other receivers around like this, other than the Scout ?

Myself, I'd do it a little differently. I'd call (from a pay phone) and tell whoever answered the basic facts about the deal, leaving out where I might have gotten the information.
What the police do with that information is up to them. Since they got the info from someplace OTHER than a cell phone means that they can use the info, as long as I don't tell them where *I* got it.
This way, I've satisfied my conscience, and the police can act on the info. Take out an ad in the paper? Hey, these guys carry GUNS!!

Message-ID: <seguine-2805951359160001@slip1007.sirius.com>
Source record: 255102

Startek, Opto, and some others make these Band Pass Filters which I gather limit the receiving range to a specific freq range - to lower the RF floor for better reception of a particular band. How well do these work? How are they made/How difficult would it be for me to make my own? Opto also makes an Active Pre-Selector, which is tunable (and quite expensive.) How does this work?

Thanks

The US law refers to monitoring any coversation that is meant to be
private or secure (i.e. encripted or scrambled radio, cordless &
cellular) is illegal. Ham bands are not private or secure, so it's ok.
Handheld, base station, makes no difference...same-same.

Make's no difference to me what anyone listens to, but how do you
monitor all those damn cellular frequencies. I took a look at a
cellular frequency chart and there's like 600 or so frequencies...seems
like a chore to program all those cell freqs. and keeping up with a
conversation. I get cellular image on my Pro-39 and it's annoying to
hear the cell calls while trying to listen to the local fire service
that's on the 800mhz band.

> and also info about how to connect to a PC.

Hi,

Not much help I'm afraid !

The only time I have seen a RS232 actually in place was in promotional
material. All SR-001's I have seen just had a blanking plate on the
back and I am not aware of any info on connecting to a PC. Neither am I
aware of any mods for 1KHz steps.

As far as I am aware the '001 was their one and only entry into the
"scanner" market.

I don't get it, people expect what they say on a cordless or cellular to be "private". come on, both devices have antennas and transmit using radio frequencies. If you really want conversations on either device to be private , either get a Navajo Code talker to encript your conversation or get a scrambler. when I want privacy, I use a wire line phone!!! anyone can intercept cordless or cellular, but it takes a court order to tap wire line phones!!! I have an ICOM R7100 which has a high pitch whine comming from the power
supply while it is heating up, sometimes it lasts for a couple of hours.
Is this normal?? or is there a problem about to happen???
Is it better for the radio to be powered from an external 12v source
instead of using the the internal 120V supply to cut down on heat
damage??? It gets pretty
hot. Any help would be appreciated.

What you probably were looking at was the TACAN channel the pilot had last used. If you don't know, there are ground stations around the world used for navigational purposes. Many (if not most) planes including the F-16 have the capability to receive signals from these stations. There are a range of -X- channels (such as 63X or whatever you saw) and -Y- channels such as 63Y. Most stations in the United States use -X-.

AFRTS is no longer available on SW; only satellite and local AM & FM
stations at overseas U.S. military installations. You're right, they do
carry the race, tho.

I listened to it today on WHRI - Nobelsville, Indiana on 13760 and 9495
shortwave.

>

Chris-

What a lot of people sell as low/high/band pass filters are relabeled filters
from Mini-Circuits in New York. Assuming that your receiver is in a good
enough case so the main signal input is the antenna, and not the sides of
the box, they can work pretty well. Mini-Circuits will be happy to send you
a catalog- they also take credit card orders. The hi, low or band pass filters
with BNC connectors are around $35 each. Call 'em at 718-934-4500.

Their west coast distribution is in Los Altos, at 800-654-7949. They are also
stocked by Penstock in Sunnyvale at 408-730-0300.

Typical performance- BHP-400 high pass filter <1db loss from 395 to 1600 MHz,
down 20db at 290 MHz, down 40db at 210 MHz with a VSWR of 1.7.

You can certainly design filters like these yourself. You can even build them,
assuming you have a good assortment of silver mica caps, wire for the inductors,
and the necessary test equipment and jigs to tweak them into shape. You'll
probably have a hard time though building 'em as physically sturdy as the
mini-circuits filters.

cheers-

: On 24 May 95 07:26pm, WTURBIASZ wrote to ALL:

: W> Check with your local aouthorities. It really depends on what state you
: W> live in. You best bet is to get a ham license and then your exempt from
: W> most of these laws.

: This is a common thought, though in error.
: The Federal rules only exempt AMATEUR equipment capable of scanning the law
: enforcement bands, not scanners.

There are two things involved. Yes, the FCC preemption for amateurs
does specifically mention amateur transceivers, but that certainly would
include the ICOM 2SRA which is a 144MHz transceiver with full scanner
capability from 30MHz to over 1000MHz.

Additionally, as it now stands, every state (about 6 or 7) that bans
mobile scanners does now exempt amateurs regardless of the equipment.

: It's up to the locals as to whether they will extend the exemption to
: scanners. (If they were of a mind to confiscate the amateur equipment in the
: first place, the chances of them extending the exemptiom would seem to be
: slim.)

There are some local (i.e. county or city) scanner bans (someone
once mentioned Kansas City) that do not have any amateur ecxemption.

Check out my home page for the prodouct called DAP2 decode-a-pad. It allow
touchtone decoding using your IBM or MAC via the COM port. Here is some
data on it.
H4> Decode-A-Pad Touchtone to RS-232- 300 BAUD Converter for ALL
COMPUTERS"

Program your computer in basic to:

* Decode multi-digit "touchtone strings" from any audio source!

* Sound alarms

* Observe secret codes

* Includes basic program for C64, IBM, MAC computers

The Model DAP "Decode-A-Pad" touchtone to RS-232 Interface
converts touchtone audio to serial 300 baud data for use with any computer
RS-232-C port or directly into a serial data printer. The touchtones convert
to
ASCII symbols, letters and numbers, which can be displayed on the computer
or used as part of a computer program. A simple basic program is provided
which allows the computer to display all digits received while acting as a
decoder for any length string of digits. Single digit buffering and the 300 ba
ud
data rate assure no loss of data information. The installation of the DAP is
simple. The user provides +10 to12 Volts, regulated D.C. and audio. Any
terminal program may be used to receive the digits. Since only one way data is
being sent to the computer, only one half of the RS232C port is being used by
the DAP which requires a two wire connection. An LED indicator provides
valid data indication. All inputs and outputs are via a DB9 connector.

Specifications: Size: 3"x 3"x 3"
Audio input: Touchtone 200 mv to 3V RMS (A.C. coupled)
Power Supply: 10 to 12 Volts D.C. regulated (30 Ma.)
Output Connection: two wire; signal and ground
Data output: RS-232; 300 Baud serial data with digit buffer
output can be fed directly to serial printer or computer RS-232-C.
Data output format: one ASCII character output for each of the 16 touchtone
digits
Touchtone decode speed: 20 Milli Second per digit (maximum)

Software Required: Any terminal program can be used and a simple Basic program included

Model DAP2 $99.95

It's a slightly better performer than the stock ICOM IC-R1 ... which isn't
saying much. Another compromise of size over performance.

4074. Radio Shack PRO-26

Date: 1995-05-29 00:00:00 UTC
From: scottc@cais.com
Message-ID: <scottc.3.001A73A6@cais.com>
Source record: 254981

I was in Radio Shack the other day and checked out the PRO-26 (I believe that was the model). Anyway it is a hand held that was around $389.00. The thing I'm looking for that this scanner has it continuous coverage from 25 MHZ through 1300 MHZ. The only thing it skips is the Cellular bands, which I don't care about. What I want is to be able to listen to air traffic and military in the bands that aren't picked up by my BC 200XLT. To make a long story short is this a pretty decent scanner? Are there any offerings from Uniden that are comperable? It must be a handheld. Any input would be greatly appreciated...

4075. Want Portable Scanner Info Help

Newsgroup: rec.radio.scanner
Date: 1995-05-29 00:00:00 UTC
From: bryant6634@aol.com
Message-ID: <3qd88r$fqa@newsbf02.news.aol.com>
Source record: 254982

Can I get some input as to what a "good" portable scanner that has similar capabilities to the Pro2004 that I have..... I know this is a subjective request....but what the heck....

Understanding of course, that 800cell stuff is now blocked, a used one that does cover that range makes sense, but I am also considering a new receiver too.... I keep coming back to the AOR brand... and I sort of like the idea of a computer control version too....

As I have made no commitments to ANY brand or flavor, I'm wide open to ideas....

Please send e-mail to me at : bryant6634@aol.com

Thanks...

Ed,
I am not aware of any mods for the Pro-62.
The unit is made by GRE for Radio Shack.

Nationwide, that's changing drastically, though. The next decade will see an explosion of mobile data systems in law enforcement and public safety. This is being driven by a number of factors:

1. Mobile data systems are saving on dispatcher costs by drastically reducing personnel needed for field data retrieval

2. Most agencies are converting to Computer Aided Dispatch, which interface well with MDTs. This permits officers to receive assignments, update their unit's status, and make internal queries without dispatcher intervention.

3. Many agencies are computerizing their internal recordkeeping, and MDTs allow direct access to this information by the officer in the field.

4. All data transmissions are by definition much more secure than clear voice transmissions.

It's coming: MDTs have more than doubled nationwide in the last five years, and expectations are that the number of MDT systems will rise exponentially in the next decade.

Anyone got any idea about where to find the freqs used by the helicopters that hospitals have transporting patients and for life flight? I have looked everywhere I know where to look including Aero freqs and the hospital freqs. Any help would surely be appreciated. Also the if anyone could tell me where to find the freqs used by the news helicopters. They do not seem to be on the regular used freqs of the T.V and Radio choppers.

4085. Fairmate HP-200E problem

Newsgroup: rec.radio.scanner
Date: 1995-05-29 00:00:00 UTC
From: John Daragon <john@argv.co.uk>
Message-ID: <801786472snz@argv.co.uk>
Source record: 254992

I've picked up a FairMate HP-200E handheld which seems to receive at a
frequency which is consistently slightly higher than that displayed on
its little LCD. The 10.000 MHz Rugby signal (for example) is at
an indicated 9.965 MHz.

Does anyone out there have any information about this beast or any idea
what (if anything) I can do to fix it ?

(Braces himself for stream of "you bought _WHAT_ ? " responses ...

Greg,

You need either a letter from a sheriff or police chief or a ham radio license to legally use a scanner for mobile applications. Other than that I think that's it legally.

Here's my list of essential Rochester frequencies..... Enjoy!

Hey, Mike, just an observation on the ongoing MT/Grove Enterprises conflict of interest thing - Uncle Bob Grove has been giving the separation of Grove and MT equipment reviews a pretty fair shot (I figure he may be getting through a LOT of Maalox, but he has stuck to it so far!). I've done a few reviews for 'em now and I suspect that one may have caused a little pain, but it was published anyway without any strategic editing. The guy *is* giving it his best shot by getting out of the reviewing business himself and only using outside reviewers for most stuff.

(Anyone ever notice the more than passing resemblance between Bob and Fred Rogers? <grin>)

They don't have, and don't need, CID. They have the same service that the 800 number users have - which provides the phone number - outside CID. It is a service that CANNOT be blocked.

: damage??? It gets pretty
: hot. Any help would be appreciated.
: bberg99828@aol.com

--

I haven't noticed any strange noise from my 7100. It does tend to run
quite warm though! The receiver does run a **lot** cooler off of a 12V
source, which tells me that most of the heat is generated from the 12V
power supply!

Hope this helps!

Recursive - see recursive.

Did Dave Hayes release the code to LEGG? Has Lazarus been ported
to MS-DOS? Does Douglas Hofstadter run a Fido-Net site? :-)

I will refrain from issuing any further cancels at the moment.
I suggest that readers of rec.radio.scanner contact the postmasters
at nisc.fidonet.org (expect an automated reply) and zeus.ieee.org (the
site that is supplying the feed to nisc.fidonet.org) with a short and
calm note to explain what is happening. It is rare to see a gateway
broken *this* badly! *Sheesh*.

Well, at least this illustrates the point I was making about mass
cancels being a form of spam. :-)

If it becomes necessary, I can cancel these by posting the
cancels to a different rec.radio group... I'll sleep on that idea.

Best wishes,
Dick

Message-ID: <3qbo52$v47@uwm.edu>
Source record: 255051

I will be travelling through Iowa in mid-June along I-80, from the Quad cities through Des Moines and south on I-35 on my way to Kansaas City. I would appreciate information about what frequencies the Iowa State patrol uses. I know my travels will take me through a rather large chunk of the state, but even a few frequencies to punch in on the scanner would be nice.

Also looking for Missouri State patrol freq's also.

Live in Wisconsin and cant afford to order a "police call" volume to cover those states from Radio Shack just for this special trip.

Thanks in advance.

Jeff, NI9E

If the Fed's tapped me they wouldn't get anything. Should a criminal do
it, they can get credit cards #'s and all sorts of stuff. Think about
what the feds can get on you. Probably nothing. And if they really need
to tap ypur phone you'll never know. You can buy all sorts of "Bug/tap
detectors" but they won't help you a bit.

From: vicdevore1@aol.com
Message-ID: <3qdk0h$j8d@newsbf02.news.aol.com>
Source record: 255065

Is the Broward BSO on trunked system, I do think so but I am not sure. If so, or if not, what are the freqs? I have a list for 22 or some freqs for the BSO, but I am totaly confused with the way that the system is. Each channel always has activity, and I don't understand how there are so many dispatchers. Although, I would see how the channels are for different areas that sort of work on their own. What channels are for what? I will often here EMS activity also, but why are the EMS and the BSO together, aren't they two different services. I guess if I could just understand what channels are for what, it would make some more sense. But, do the channels constantly change each time a radio is keyed? Im sure that somebody in Broward has got at least some of this info, and any of it would be very very nice. I, ofcourse, give thanks in advance to who ever can help me out,
later,

I have news for you, John. It takes a court order to listen to cell or cordless phones, just like a hardwired phone.
At least to do so LEGALLY. Anyone with the proper knowledge & hardware can illegally listen to your hardwire phone conversations. Don't make the mistake of thinking your hardwired phone is somehow immune to being illegally tapped.
This is one reason I find all the discussions of which cordless phones are the most secure to be a little silly. Only the link from the base to the handset is secure.
In fact, I can't think of any reason anyone who really wanted to tap your phone conversations would use a scanner and only get the cordless conversations, ignoring the hardwired phone conversations. Seems like whoever does that is a can short of a six-pack.

My R-7100 is run from a 13.8 volt external supply (as are my other radios).
Yes, I'd say your power supply is heading for a problem. It's certainly not
normal.
Is the warranty still in effect? If so, get this taken care of.
Power it off an outboard power supply for several reasons, not the least of
which is, that's an expensive radio. You want to do all you can to protect
that investment. Heat is the biggest destroyer of electronics, and inboard
power supplies put out heat.

I just purchased a Radio Shack Pro-62 scanner.

Does anyone know any MODS available for this scanner?

Does anyone know who really makes this scanner and what the other model numbers might be?

Thanks,
-Ed

From: chohan@magnus.acs.ohio-state.edu
Message-ID: <3qg1jn$7o1@charm.magnus.acs.ohio-state.edu>
Source record: 254928

I've inherited an old BearCat 100X? from someone, which I cleaned up
and got working. Unfortunately. it didn't come with a manual.
So far, from what I have been able to figure out, I can enter
frequencies in its 10 banks of 10 memories each, and hit scan
for it to cycle through the frequencies in selected banks.
This scans through the entered/selected frequencies.

However, I was wondering if there is a way to enter a starting
frequency, and a step size, and tell it start scanning in those
increments. This way I can scan a range without having to enter
each frequency manually. Is there a way to do this.

Any help much appreciated. Many thanks in advance.

The military uses the band from 32 or so mhz to 72-75 or so mhz for general
radio transmissions, you might check there. :) Otherwise, one of the
frequencies we use in VHF isin the 139 mhz range...

>Does anyone know any ACTIVE military aircraft frequencies in the
>Eastern Massachusetts Area??
>Thanks
>jim < jamesmc@delphi.com

I can't give any frequencies for the Northeast but you can use one of the two methods I have used for finding some of them.

1. Some UHF "military" freqs are shown on aeronautical charts and other publications like the Airport/Facility Directory. These items are usually available at a local airport that sells pilot supplies. Ask for a local "sectional chart" or "enroute chart" or A/FD. These items don't give you all of the UHF freqs but they usually have them for FAA radar facilities.

2. If you listen to radar services on the "regular" aircraft band, and you can actually hear the controller from your location, listen for "handoffs". When an aircraft is handed off from one controller to another ther first controller gives the pilot the next frequency. Often controllers that are working military traffic are simulcasting on VHF/air, therefore you will hear the controller on VHF when he is actually talking to a plane on UHF. When they handoff a military aircraft they will usually give a VHF and UHF frequency - and the military pilot has a choice of which one to use. A normal handoff may sound like, "United 1234, contact Bay Approach on 134.5, good day." A military handoff might sound like, "Navy 1234 contact bay approach on 134.5 or <some UHF freq>, good day."

You will hear radio checks every once in a while on 243.0. This is the UHF distress freq - the equivalant of 121.5 on VHF. And before anyone tries to tell you that 243.0 is not UHF - it might not be. However the 200 and 300 freqs used in aviation comm are refered to as UHF.

Message-ID: <3qg9e7$lmq@Sequoia.picosof.com>
Source record: 254935

Lets not be fooled people into thinking that ALL cops
bother to get a warrant.Not so honest law types will often
"wildcat" a cordless.Usually early in an investigation.this
is done without the courts knowledge or the D.A. office.
The cops own supervisor wont even know.The practice usually leads
to other info that CAN be used to get a warrant by more tradition
methods.It is also useful for tying certain elements of an
investigation together.The technique often backfires in the
officers face(usually on the witness stand)and can pretty funny
to watch.Needless to say The cop gets charged and fired...the case
thrown out...and we in the media have a field day.It's not
widespread but from time to time is happens.Most narcs have
stories to tell about the practice,Like the time DEA was
giving cordless phones to informants to give to dealers.
That was in the mid 80's.Much cheaper than a real tap.
YES,the law has changed since the 80's but dont be fooled
IT CAN AND WILL HAPPEN AGAIN.

Thats my two cents...I'm Kent Brockman

You can still 'own' a scanner that can do this, you just can't
manufacture one for sale in the U.S. that has those capabilities.
But, I think you mean-how come we can't listen to any spectrum
on the frequency band? Well, the answer is,: we can! who's going
to enforce this law? Is the FCC going to come busting down my door
because they 'suspect' I'm listening to cell or cordless traffic?
I can see it now--"drop those earphones and change frequencies or
we'll shoot!" :)

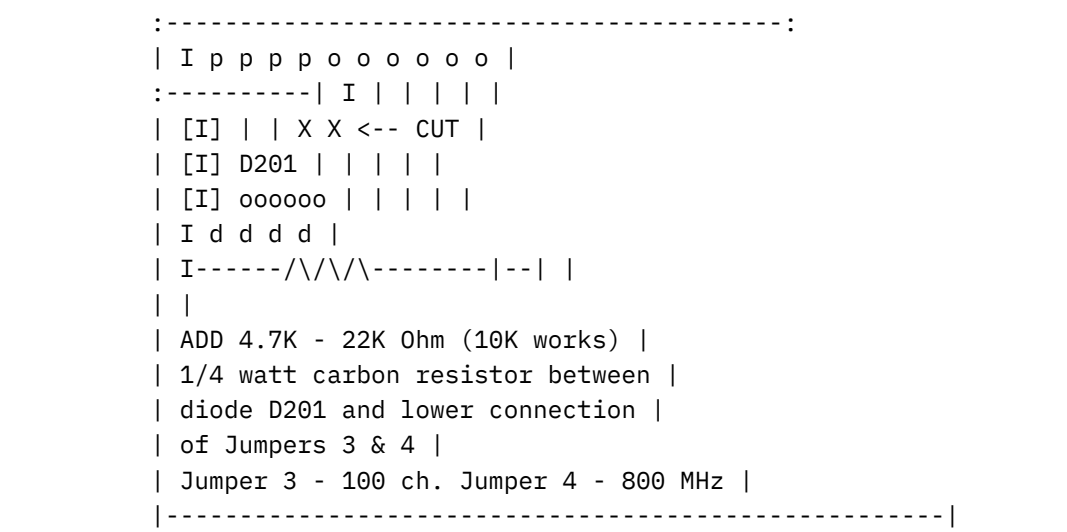
Here is a MOD that is really easy:

Here is a repost of John Wilkerson's article from Feb 1993
on modifying the Uniden 855XLT:

DISCLAIMER: This article is listed for the
technically curious. No guarantees
are
stated that the mods listed below will
work on all scanners of this model.

UNIDEN BC-855XLT MODIFICATIONS
Scope of modifications:
[1] Allow continuous 800 MHz receive.
[2] Increase channel capacity from 50 to 100 ch.



1 2 3 4
I p p p p o o o o o o
I
[I]
X X <-- CUT
[I] D201
[I] oooooo
I d d d d
ADD 4.7K - 22K Ohm (10K works)
1/4 watt carbon resistor between
diode D201 and lower connection
of Jumpers 3 & 4
Jumper 3 - 100 ch. Jumper 4 - 800 MHz

1. Remove 5 screws from bottom of scanner case.
2. Carefully separate case top and bottom.
3. Unplug connector to the internal speaker.
4. Locate diode D201 and 4 jumpers near edge of circuit board.
5. Cut the 3rd and 4th jumpers near the middle and fold
downwulate leads, if necessary.
6. Connect the lower part of jumper 3 & 4 to one end of a 10K
Ohm 1/4 watt carbon resistor, insulate all exposed leads.
7. Connect the other resistor lead to the lower connection of
diode D201, DO NOT cut any leads on D201.
8. Make sure all exposed leads aren't touching any other
connections, insulate as required, tack in place
with a dab of RTV silicone, or low temp hot glue.
9. Reassemble scanner, make sure to plug the speaker back in.

You should now have a scanner with 100 chs. numbered 01-00
in 5 banks of 20 ch. and continuous 800 MHz coverage.

WARNING!!! Doing the mod to jumper 4 REMOVED 75 percent of the 800 MHZ
Band on my Scanner. Replaciing the jumper restored the
coverage to design limits, without harming the Scanner.

My serial # is 25021343.

I suspect different boards have been used in this scanner.

JG>I am in desperate need of a pair of 2 way radios, VHF or UHF,
JG>doesn't have to be fancy. Needed for summer baseball tournaments.
JG>Will pick up within Sothern Ontario. Reasonably priced
JG>Cash, of course.
JG>
JG>Please email me or call my pager at 416-382-0156

Easiest thing to do is to pop by Radio Shack and pick up some of the
Spirit portables. Probably would cost you $200 each.

How did you make out with your MT2000/Visar's? Just in case you didn't
receive my last message, I figured:

$200 U.S for 3rd party RIB and cables for the Visar/MT2000.
$800 Canadian for the Motorola proprietary software.

The cables can be had from any of the advertisers in Mobile Radio
Technology and the software can only be had from Motorola. A friend
just purchased a cable and RIB for the MT2000 and he paid $150 U.S.

Steve

p.s. if you want to sell the VISAR or MT2000's let me know. My friend's
a dealer and is always looking for rental radios.

LD> Wanted: Information on the Best Scanner antenna on the Planet!
LD> With wide coverage.
LD> You help will be appreciated.
LD> Thank you!

Go find the most expensive discone you can, and buy it.
Or, buy the Diamond discone. (Maybe the same thing!)
Discones have a frequency range of about 40~1300 MHz, with no gain, and no directionality of their own.
Another way to get good coverage, with some gain, would be to buy any of the better Tri-Banders. These cover VHF, and UHF Hi & Lo. Since they are really three dipoles in one design, they offer some gain, but not as wide a bandwidth as a discone.
yet another choice for a quality antenna would be a TV antenna with the elements mounted vertically instead of horizontally, with a rotator. This will provide at least as broad a bandwidth as a tri-bander, with the addition of good directionality (that's why the rotator); better gain than a tri-bander, with poor reception from all but the front.
As you can see, there are compromises, with no such thing as "the best". They all do the reception thing a little differently. Broad bandwidth and high gain are not mutually compatible. Directionality gets great gain, but you will need something else for wide area coverage. Discones offer great wide area and wide bandwidth, but no gain. Tri-banders offer better gain than the discones, but only cover the more popular bands.
Some people use a discone for general scanning, and switch to a directional antenna for those quieter signals. This can offer the best of both worlds, but increases cost.
Hope this helps.

R> with. <G>

I think we've been here before, although you've now used "cell images".
You don't seem to understand the difference between cell freqs and cell
images (witness the "Au Contraire", above).
it is indeed illegal to import into, or manufacture in, the U.S., any
scanner capable of tuning the cell frequencies, or of being easily modified
to do so.
Your BC300XLT does not prove that wrong, as you are receiving images of cell
calls, on, as you point out, 1005 - 1030 MHz. These are NOT cell
frequencies. It makes no difference where you bought the BC300XLT, the fact
is, cell capable scanners are illegal to import or manufacture in the U.S.

Bill Funk

I think the AUTO SEARCH/STORE is the best feature of the 9000xlt. I used this feature each day to auto store certain bands during the day, looking for new, unlisted freqs. This has been by far the best feature of any scanner I've used, and the 1 search range is no problem for me. I wish it had multiple search ranges IF I could link them together. Perhaps some future version will have these features built in.

BTW, I also have an 890xlt and prefer its display over the 9000xlt. The dot matirx LCD display takes some getting used to, but I like the scrolling status displays when prompted. Can't make everyone happy, eh :-)

Mike,

The last year I went to the tournament I was able to locate several frequencies used by the TV coverage by scanning in the 154 range. Radio Shack's Beyond Police Call also listed Muirfield security. (I'm thinking that the grounds crew was in the 460-465 range) I'll look up those exact frequencies when I get home and repost them then.

: >Contrary to what they show on TV, few agencies have terminals in
: >their vehicles. Everything is transmitted by voice.

: Nationwide, that's changing drastically, though. The next decade will
: see an explosion of mobile data systems in law enforcement and public
: safety. This is being driven by a number of factors:

: 1. Mobile data systems are saving on dispatcher costs by drastically
: reducing personnel needed for field data retrieval

: 2. Most agencies are converting to Computer Aided Dispatch, which
: interface well with MDTs. This permits officers to receive
: assignments, update their unit's status, and make internal queries
: without dispatcher intervention.

: 3. Many agencies are computerizing their internal recordkeeping, and
: MDTs allow direct access to this information by the officer in the
: field.

: 4. All data transmissions are by definition much more secure than clear
: voice transmissions.

: It's coming: MDTs have more than doubled nationwide in the last five
: years, and expectations are that the number of MDT systems will rise
: exponentially in the next decade.

Well then, I guess we will have to come up with some way of watching our
scanners. :-)

Source record: 254954

I can't believe that you have never overheard a conversation between two people and purposely hung around to hear or try to hear the whole conversation. I think its called eaves (sp) dropping and everybody has done it at one time or another. It is very similar, only you are doing it with a scanner. Some people have some pretty interesting conversations over the phone. Sometimes you may be the topic of conversation.

I don't care who you are, but if YOU are the topic of converstaion, you want to know what is being said.

I don't spend hours trying to pick up a cordless conversation, but if I come across one while scanning for other things, I will listen to it.

Regards,

Sam

4157. NRZ?

Newsgroup: rec.radio.scanner
Date: 1995-05-30 00:00:00 UTC
From: john.burt@aquila.com
Message-ID: <f.19691.2391@aquila.com>
Source record: 254955

CC> What exactly is NRZ code otherwise know as phase-key shifting?

NRZ usually means Non Return to Zero.
This means that between individual data bits the signal doesn't revert to the zero state. For example, if you are sending a byte full of ones in RS232, the signal would stay at the "one" level for all 8 bits instead of going back to zero between bits. Synchronization is accomplished with the "start bit" at the beginning of each byte, and then the receiver has to sample the signal at the correct times for each of the eight (or however many) data bits.

Phase-shift keying is a method of modulating a signal for transmitting it. I don't think it is limited, in concept, to NRZ data formats, and NRZ data can certainly be transmitted by keying methods other than phase-shift.

Source record: 254957

LL> > Operator, I frown upon those of you who use your scanner to listen to
LL> > innocent people's telephone conversations.

LL> Sanctimonious Ninny

Well, I can see both sides of it. Personally I wouldn't want people tapping into my telephone and listening to 'private' conversations. However, it takes a bit more effort to do so, effort that only 'professionals' would have the experties to do. On the other hand, I don't carry on conversations by means of public services which I expect to remain 'private'. I suppose that is the paranoid in me. I suppose one should expect it and take precautions against the 'deliberate intrusion' of what could be considered legally to be a 'reasonable assurance of privacy'.

So, where do we draw the line. With just a few dime store parts I can listen to private family conversation without the invasive action of wire taps or 'bugs.' The CIA uses such a device to listen in on whisper quiet conversations.

Maybe I am a santimonious ninny, too. We all have SOMETHING to hide.

>
> Jim
> jwayda@netcom.com

Jim,

Maybe I've been lucky, but I use both an indoor and outdoor antenna set-up and so far no birdies. For the first week or so with my new BC9000, I used the indoor only and did notice some slight "white noise" that stopped the scan below 160 MHz ... actually from about 26 or 27 MHz to about 158 MHz. With just the outdoor discone or beam, most is eliminated but the low end around 30 - 50 MHz still has a stop or two due to "white noise".

This is absolutely no real problem since I've L/O the 2 or 3 freqs. that cause the problem. And, no matter what or when I return to them to check, there is usually still some hash or "white noise" present.

Due to lots of storms this past week, I've been on indoor ant. only with little or no problem. Of course, I'm in an area with lots to monitor in the strong signal variety.

What I really do like about the 9000 is its' ability to stop the interference I was receiving with several Radio Shack trip-conv. models. The ATT key and whatever circuitry is inside the 9000 is simply superior to the RS equip.

Good Luck Jim .... and HAppy MOnitoring

Our European office in the Baltic States has a source for these... They are small optional decoder/descrambler circuit boards that can be mounted inside the AOR AR8000 for tone inversion / speech inversion (SI).

Message-ID: <seguine-3005951042020001@slip1007.sirius.com>
Source record: 255010

I'm wondering if this is a good idea. I would like to run two scanners off one antenna, and I'm wondering how much signal loss there will be. In the Grove catalog there is a PRE-5 signal booster, which is some sort of pre-amp, but it does have outpuut for two scanners. How well does this work? Will there be any interference caused between the two scanners on the same line? My setup is a Channel Master (excellent antenna by the way) and an AOR-8000 and a PRO-2006.
thanks

4176. Military Helicopter Frequencies

Newsgroup: rec.radio.scanner
Date: 1995-05-30 00:00:00 UTC
From: domonkos@access.digex.net
Message-ID: <EusoliubG6r2079yn@access.digex.net>
Source record: 255012

Has anyone had any luck monitoring military helicopter comms? I've had no such luck here in Maryland, and with Aberdeen Proving Grounds right next door and dozens of Apache chopper's in view everday I have yet to hear any on any of the listed active frequencies for the bases here in Maryland. I 've heard nearly every other comm possible here but have yet to catch helo's. I'm hoping someone has had better luck. Thanks.

Andy

4177. What is Cheapest place to buy?

I am looking for the phone number of the cheapest place to buy a
Uniden Sportcat 150. I had a number of a place - Scanner World???
that sold it for $175, but of course I lost it! If you know of a place,
please post or e-mail me. Thanks

Joe ,,,

The cell images are receivable on both the PRO-26 and BC3000XLT,
but are much weaker on the PRO-26.

> Therefore, how can the PRO-26
>and the BC3000XLT be the same radio internally?

Although there are similarities, they are not the same radio
internally or externally.

How's the glass house?

Never went over the speed limit?

Never 'fudged' on you taxes?

> I don't get it.

Probably not and you probably never will.

So there you are tuning the 800 Mhz band and you hear a conversation about a plot to kill your relatives. Going to do the FCC morality thing?? Going to just act as if you never heard it?? Yea I bet.

Are you just pissed because you are too small to get on any soap box??

4180. BC9000XLT + Indoor Antenna

Newsgroup: rec.radio.scanner
Date: 1995-05-30 00:00:00 UTC
From: jwayda@netcom.com
Message-ID: <jwaydaD9D94r.J4o@netcom.com>
Source record: 255016

Does anyone have any experience using a BC9000XLT with an indoor antenna located very close to the scanner? The MT review by Bob Parnass states that the scanner will receive some of it's own internal birdies. The article also states that this problem is eliminated by the use of a roof top antenna. Could someone with a 9000 please give this a try with an indoor antenna. Bob Parnass states that the birdies can be heard near even mhz boundaries. Are these birdies severe enough to effect scanning by causing the 9000 to stop on these frequencies?

Jim

>Are there any other receivers around like this, other than the Scout ?

Yes, the documentation supplied with the Scout v3.1 or the 'soon to be
released' ARCX cable (for use with Scouts v1-3.0) contains an illustration
for the modification for use with the AOR2700.

Just some additionally info... The AOR AR8k always used an FFC adapter.
The first release of the AOR2700 used some other type of 'molex-like'
connector. The CURRENTLY SHIPPING 2700s now use an FFC adapter like
the AR8ks. I guess they received a number of complaints from the 3rd
party interface companies that they didn't want to manufacture two
seperate interfaces..

The AOR 8000's that are available here in New Zealand are not blocked
in anyway, so it can't be that hard to unblock the ones in the US.

I have been searching everywhere for mods for my RS Pro-46. I have seen a few postings that say some of the models (depending on the ser # or prod code) cannot be modified for full 800mhz. Can anyone shed some light on the subject for me? I assume my production code is 4A4, the FCC ID printed on the back is AAO20-305AI and the serial # ends has no letters in it. I eventuially plan to get a better handheld, but until I scrape up some $$, this will have to do. Any response would be appreciated.

Sorry, the 2SRA is not a scanner. It's a tranceiver with scanning
capabilities, and is specifically amateur radio equipment. It's covered
under the FCC pre-emption.
Scanners are not covered under this exemption.
What I wrote was pretty specific. It's quoted above. It's not in error. Why
correct me when I'm not in error?

Chris, I use 3 different scanners on one antenna (RS ground plane), with a splitter from RS. It's a TV splitter, and I haven't noticed any signal degredation at all. I'm in a strong signal area, and I'm sure that's a reason it works so well for me. Less expensive than an amplifier.

Try telling all of that to Randy Weaver (RE: his dead wife and
kid, courtesy of the BATF et al), the Davidians, and all the other
more-or-less innocent folks that have gotten shot, trampled, beat up,
abused, etc. at the hands of the various OVERempowered federal thugs.

Yeah, they may have sworn an oath, but to whom and with what
content I have begun to wonder....if it was to the US Constitution then
it must be a different one than the one *I* was taught in school.

Many law enforcement agencies have a "tip" number that you can
call anonymously, from a pay phone if you want. If you find out about
some seriously illegal activity and your conscience bothers you enough,
try looking for this service....

>detectors" but they won't help you a bit.

Guys - let me add to your paranoia. :-)

The NSA/NRO has been listening to domestic phone traffic for YEARS
via one means or another. They just listen in on the microwave relay
stations (amongst other neat tricks) and thus don't have to worry about
"tapping" your phone - that's kid stuff to the big boys.

Quite frankly, they aren't interested in acquiring your credit card
numbers - they have computers that listen in for key phrases of certain
types (which are mostly related to the activities of, shall we say,
"foreign dignitaries and diplomats"). Although I'd bet that their computers
might also key on "Groom Lake", "Area 51", and other related topics....

What *IS* scary about that is that they might share such
technologies with the DEA/BATF et al......

As for simple cordless phones - don't bet your ass that local
police agencies don't listen to those frequencies....possibly even cellular
calls. Keep in mind the kinds of laws that have been kicking around regarding
encryption - the FBI et al have been *insisting* that if individuals
are to be allowed to encrypt their phones, then FBi et al should have
the encryption keys to be able to tune in. That strongly suggests that
they have ALREADY been tuning in and don't want to LOSE the easy ability
to do so.....

Sometime, you might want to pick up a copy of Burrows' book,
"Deep Black"....

>to enforce this law? Is the FCC going to come busting down my door
>because they 'suspect' I'm listening to cell or cordless traffic?
>I can see it now--"drop those earphones and change frequencies or
>we'll shoot!" :)

Exactly! Good one, Scott. :-)

Keep in mind the situations in both Nazi Germany and Stalinist
Russia, amongst others, where people were taken out and SHOT for
owning contraband radios......

I would hope that if anything like that ever came CLOSE to
happening here in the US, the good citizenry would openly revolt....
assuming, of course, that BATF hadn't confiscated all the guns by that
time.....

(Did you know that there are people who are acquiring or
making lead-lined or otherwise shielded containers that are also
waterproof so that they can BURY caches of guns and ammo in the event
that all guns become illegal? Is that paranoid or simply a
logical precaution to what they see happening in DC these days?
You be the judge.....)

You know, I find it amusing that in the early part of US radio
history, guys like Crosly would put up a 100 kilowatt radio station,
and then manufacture and sell radios that would only tune THAT
frequency! The congress stepped in with the (several) Federal Radio
Acts and put an and to that sort of monopoly of the spectrum.

NOW, the congress is trying to give/sell monopolies to the
spectrum.

Can we say, schitzoid?

4204. Military Helo Frequencies

Newsgroup: rec.radio.scanner
Date: 1995-05-31 00:00:00 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <3qi00l$9g3@umcc.umcc.umich.edu>
Source record: 254890

The more modern/updated military helos these days would have voice capability on the following freq ranges: 30-88MHz ('Fox Mike' band, for tactical comms. Units could have SINCGARS radios, which is an anti-jam [freq-hopping], secure voice [& limited data] system), 108-152MHz ('Victor' band -- some of the newer radios are capable of going up to 174MHz) AM/FM, and 225-400MHz AM ('Uniform' band).

Newer, medium/long-range US military helos also have HF capability, mainly used during nap-of-earth ("NOE", meaning they're flying too low to get decent range on VHF/UHF) flight profiles. Such Army helos mostly use the Army's HF anti-jam/secure voice system.

Special Ops & command & control rotary-wing platforms also have UHF SATCOM capability, either permanently installed or as part of a portable comms package. Special Ops helos also have some additional secure/low-probability of intercept comms systems.

Older helos which haven't been updated might just have Fox-Mike/Victor, Fox-Mike/Uniform, Victor/Uniform, or even just Victor capability.

Easiest way of getting their freqs & info on their comms capability is to look at their radios & channels lists in the static-display helos during a base open house/air show.

TODAY IS MY TURN TO ASK THE STUPID QUESTION.

I am using my AR8000 with SC8000 soft leatherette case, the clear plastic covering is sticking to the LCD display window, making the display difficult to see, for some reason this is disturbing to me.

Can I do something about it?
Is my protective case defective?
Do I need to learn to leave with it?

The MX-7000 was a cross between the AOR AR2001 (MX-5000) and
AOR AR2002 (MX-8000). It had the frequency coverage of the AR2002 but
in the "case" the AR2001. This meant the membrane keypad and no external
interface.

You may get better luck via an AOR dealer rather than Uniden who "took
over" Regency in the US.

your offer sounds cool! I would really like a transmitter more like 10 watts, but I would settle with less if I really had to... I would like to set up a temporary radio station during hurricane season, ofcourse I don't want to set up a huge antenna or register any thing with the FCC. I just want distance, like 3-5 mile radius, on flat ground in Florida ofcourse. I would like to have stereo inputs, I guess just two inputs, one stereo and one mic, or something like that. I would also like it to be under $130.00 or so ($40-$60 would be ultimate). E-mail me all the info you've got available, because you just may have something like I need.

I have a Pro-2005 in nearly perfect condition for sale. 800-modded
AND a speed increase mod performed. Whip antenna missing, although
you can probably get a replacement (or I can) through Radio Shack.

At any rate, it works great and is getting used pathetically little
for such a nice scanner in itS PRESENT home...I have the manual and
a single sheet of paper describing the 800 MHz mod (I bought the
scanner pre-modded).

Asking $275 and all offers considered. $275 gets it outright.

Each port on a passive, two port T.V. coax splitter will reduce the signal by
about 3dB. If you have enough capture to tolerate this it should work fine.

The mod has been know for a very long time now. It requires reprogramming the
firmware in the radio. I know ScanStar (PC Control program) can do it. You
can also clone the radio with a UK version and restore it.

Does anybody know the frequencies for Detroit's air units? Do they use the standard Detroit police frequencies? Also, about a week ago I posted a request for some frequencies (Summit Place Mall, Book Building, etc.) and I was getting help from somebody but I didn't answer his last message soon enough and AOL deleted it. Now I can't remember the person's name. The only thing I remember was a partial e-mail address: oeonline.com (Observer-Eccentric Online). If that person reads this, could you please e-mail me? Thanks!

Mike

I wondered this too, so I called Uniden and the rep I spoke with said the
display used on the SC-150 is used on other Uniden scanners, so the police,
fire/emg, and mrn labels CANNOT be used on the SC-150. Sorry.

Source record: 254913

There is a new repeater in Lincoln County Oregon that covers the N end of
the county. It was licensed some time between Nov 94 and Feb 95. Police
Call and every other site I've checked doesn't have it. Supposedly it was
active in Nov. but used only in a pinch. I think the actual licensing may
have been in Feb. Does any one know what the new freq is???????
I had an article from the local paper but it failed to mention the new freq.
Also, does any one know the frequency OSP uses in in the Newport area??
I've plugged every freq in Police Call into my trust BC200XLT but fail to
get any hits.

Thanks

Hey! BTFO! Back WAY off! This kind of ranting doesn't belong here and is only tangentially involved (if at all) with the issue at hand. If you want to kvetch about this kind of thing take it to alt.conspiracy.paranoia or wherever. I'm CERTAINLY no bleeding heart liberal and don't hold a brief for abuses by authority, but this kind of in-your-face agression is NOT what I read re.radio.scanner for and I think that goes for a large number of others here. That is precisely the kind of comment and mindset that cost the gun-petters in the NRA former President George Bush's membership.

Thanks for the post. I have an R7000 that does the same thing. Never
have had time to look into it. Whine lasts only about 15 minutes and
then once its warmed up its OK. ICOM may have a service note on this.
If you find out anything please let me know.

Turn it on, while running on batteries.
Put it into the mode you WANT it to come on in.
Take out one battery briefly. Repeat until it comes on
in the mode you want it to come on.

D. Devon Johnson <darryl@freenet.fsu.edu> wrote:

>Any one ever replace the backlight in the PRO 2006?

Yes, I did it recently. The replacement part cost
under $13 plus shipping. I don't recommend this operation
unless you are comfortable repairing delicate electronics
equipment.

The replacement requires loosening and tilting the entire front
panel. You must remove all the Philips screws holding the front
(display) printed circuit board. I had to unsolder one or two
ground braids to gain access to the display side of the PCB.

Then, you must remove the glue holding the old EL light panel.
After desoldering the two leads from the old EL panel, you
the panel out from behind the LCD display.

Slide the new EL panel in behind the display and carefully solder the
two leads. Don't use too much heat.

The two leads on the EL panel are very thin and fragile.

>Is it possible to restore cellular on it?

>Thanks for any and all info,

>Rich

I have bought this scanner a few weeks ago. It is a good scanner,
except the 80 Mhz. I have a big scanner at home. He is much better in
de 80 Mhz. In the other frequency's, special in de 450 Mhz, he is very
good. With the big scanner at home i receive almost nothing on the 450
Mhz, but with this handscanner i receive very much on this
frequency's.
You can recharge the cellulars in the scanner, and it works for about
10-12 hours continuesly. A adapter to charge will be in the package of
the scanner. If the cellulars are not good anymore, you can easy
change them by new ones.
If you want other information you can email me.

4242. Parts for Regency MX-7000?

Newsgroup: rec.radio.scanner
Date: 1995-05-31 00:00:00 UTC
From: reporter@ix.netcom.com
Message-ID: <3qgf37$cuq@ixnews3.ix.netcom.com>
Source record: 254971

Hello. I'm hoping someone may know where I might find parts (specifically, the keypad) for a Regency MX-7000 I came across at a garage sale this weekend.

It seems to be a nice little unit, except someone has badly mangled the bubble-film keyboard. I tried Uniden in Indianapolis, but they say they don't stock parts for this radio anymore...offering to take the unit in trade for a unit that's newer, but...

Well, anyway, I've tried Uniden and one distributor they referred me to in Iowa. No luck. Any tips anyone can offer will be appreciated.

Thanks in advance...

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-26 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high

frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains

detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine

the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All
meetings will be held on Saturdays at locations announced
in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC(?)
August 19
October 14
December 16

Bring a notebook and your appetite.

--

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel

(e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542

Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist

called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to

determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their

transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

From: bill.dunn@channel1.com
Message-ID: <40.22630.2433@channel1.com>
Source record: 254778

This message was from BILL DUNN to ALL,
and was forwarded to you by BILL DUNN.

SC>It would be kinda thieving to send you data that was paid for, but NABER
SC>will find the best frequency for you. Just tell them what you are looking
SC>for when you apply. They will choose a frequency for you. Or if you
SC>think you have one, call them on the 800 number and they will search their
SC>records for that frequency and advise you as to whether it is an apparent
SC>problem or not.

Be real Chuck. NABER find a Best freq ??? They don't even notify
the Area Co-Shared repeaters with the area users. Not to mention
picking a Low-Loaded freq. And NABER won't even assist you in
finding out who uses the radios within 30 miles of where you place
it. NABER has gone down hill, since they have exclusivity.

Bill FORMER Naber member. (What a waste of $$$)

No, that whine is not normal. Does the whine acually come through the audio circuit to the speaker or is it acoustic only ?
Try running it from an external regulated 12v supply and see if the symptoms are still there. If everythings OK, then the fault is in the power supply unit. When you say "it get's hot",do you mean a local area of the case? Try to determine if there is also a smell from the power transformer.

Regards,
George

Actually it's easier than that. Just find out where the phone line goes
into the house and remove the little cover. Theres usually four
terminals. Get some alligators and clip em to the coreect wire and hook
it up to a tiny recorder. Leave and come back the next day to retrieve
your recorder. If the cops want to do it they just call Ma Bell and have
the switching center set up a tap. The can record as long as they want.
If you want encryption for your phone get NAUTILUS. @

FTP> ftp.spy.org. go to /mpj and read the README file.

You need a 9600+ modem and SoundBlaster. Utilizes IDEA, DES3, or Blowfish
encrytion alogorythms.

: OK, Paul - and not meaning any disrespect but I GOTTA ask.

: Given that your employer is one of the largest sellers of
: both scanners AND cell/cordless phones in the country, where does
: Radio Shack stand on this issue?

: Tell me if I'm wrong - Radio Shack will pay homage to the
: ECPA because there's more cold, hard cash in phones than there is in
: scanners, EVEN though the ECPA is just plain, dead, WRONG.

: (Taking note that one of the first casualties of the scanner
: ban was the PRO-2006.....)

: Again, Paul, keep in mind that this isn't a personal thing,
: but I will tell you that I would not spend one penny at Radio Shack
: if it were not for the fact that there is NO other electronics distributor
: in my area that is open during the hours after I get off work.
: I also do more mail ordering of some parts than I used to, rather than
: putting up with poor stocking practices and annoying sales droids.

: Radio Shack DOES have some good products. They HAD the PRO2006,
: but then we KNOW what happened to THAT.

: RS could do an awful lot to restoring not only *my* faith
: but if you read many internet newsgroups, a LOT of folk's faith
: if they would stand up and OPPOSE such bullshit legislation, and
: even work on repealing it......and if you want to know a Senator who
: went on record as being opposed, then contact Sen. Coats of Indiana.
: Unless he has drastically changed his tune, he was opposed to the
: scanner ban and wanted to see cellular users encrypting.

: Is RS willing to do what's RIGHT instead of what is
: IMMEDIATLY profitable?

: Duane

Well, I'm not gonna get myself in trouble by answering this too specifically. I am in no position to make a policy statement for Tandy Corporation. However, I can say that we fought to keep our prior product line on the shelves, unchanged. We lost.

You might also consider for a moment the relative profit margins of cell phones (a highly competitive market) and scanners. Where do you think the profit REALLY is? (Rhetorical question, please...only rhetorical answers desired :^])

MY opinion (not speaking for the company) is that the FCC's measures, and Congress's legislation, whether they make sense or not, are like throwing teaspoons of water on a stack of burning tires. With thousands and thousands of cellular-capable scanners...and even more cordless-capable scanners...the recent revisions to ECPA aren't making cellular and cordless more secure. If anything, the publicity is making them LESS secure. The major tangible effect, I feel, will be in the admissability of intercepted conversations in court. Until the changes in the ECPA, courts were using the rule of 'reasonable expectation of privacy'. Now, however, they have statutory law to follow...

: jackmor@iglou.com

No, you are not going crazy. I have the same leatherette case and
the plastic on mine also sticks to the LCD window. It doesn't
bother me too much, but it is kinda strange. You might be able
to build up the surface around the LCD display with several layers
of cut 1/4" wide electrical tape. Perhaps the plastic window
covering will 'stand off' the LCD surface and thus not have
the chance to stick. You coul also simply cut away the
plastic covering, but leaving the covering for the buttons. I would
not do this though, the LCD will invariably get scratched.

Another tip: The teeny holes for the speaker portion of the leatherette
case do seem to block the sound, and creates some resonance between
the case and the radio. I took a leather hole punch, and carefully
enlarged these to about 3/16" holes. I also added another row of
holes on the top and bottom, and the right and left sides. I
can hear the radio much better now. Be careful you get the holes
lined up so it looks decent.

4256. Blue Angels/KYIP Air SHow

Newsgroup: rec.radio.scanner
Date: 1995-06-01 00:00:00 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <3qkqvg$5n1@umcc.umcc.umich.edu>
Source record: 254832

I live about 7 miles away from KYIP, and the Blue Angels are currently up doing their practive & area orientation. They're using 275.350 & 263.350.

The guys on 263.350 sound pretty sophomoric, talking about whether the "psycho bitches" will be at one of the parties they're attending tonight, whether one of the pilots is going to "do" some girl named Sandy, etc. & some discussion about all the white-trash trailer parks in the area.

Most amusing was their belittling the soloists, who apparently are the ones working on 275.350MHz.

Show Control is just getting set up on the airfield now. I don't know what freq they'll be using yet.

Incidently, the best freq I've found to monitor for the Wayne County Air Show wasn't the Show Control channel, but a low-power, discrete link in the 170MHz range between KYIP Tower & Show Control. KYIP Tower still works other aircraft outside of the TCA, & would advise Show Control how far out the aircraft were from their flybys, etc.

Other good freqs to monitor will include:

155.865 -- Michigan Emergency Public Safety System
156.150 -- Van Buren Township PD car/car
154.710 -- Washtenaw County Sheriff Dept prep/prep & mobile extenders

In past years, I also heard some Show Control stuff on one of the VHF low power business/itinerant channels (154.57, 154.6, etc.) that was used by their ground staff.

The soloists are using 251.60.

I just found some notes concerning the KYIP air show from previous
years.

This may or may not be valid for this year's air show...

Show Control -- 122.920
Show security/ops -- 154.570, 154.600
Show concessions -- 151.625

French Connection aerobatic team -- 122.975

Show Control <---> KYIP Tower comms -- 469.475 (this is more recent than
when I caught them on a 170MHz freq).

We reviewed it in our March, 1994 issue. The tech department says
that it is a good scanner, but it is a dual-conversion scanner, so it
will get overloaded in high signal areas. It has a few nice features
like the ability to skip over the high-pitch computer tones that are
on some signals.

The Bearcat 150 SportCat is our recommendation for the races. We sell
it for $194.95 plus $8 shipping (UPS Second Day Air). The SportCat
has 10 programmable channels that you can swap through and covers the
full range that the races operate in.

Hope that helps ya.

CJ> capabile of recieving police broadcasts in the possession of a licensed
CJ> ham is OK. NYS DMV laws, check them out.

Doesn't seem to do much to post this, does it?
I've been saying for some time now that the FCC rules don't cover scanners, and I keep getting mail that tells me that "this or that tranceiver scans, and is covered". They don't read what's posted, as far as I can tell.
So, here it is, for ALL to read:

The FCC rules making amateur radio equipment exempt from local laws banning receivers that can scan/receive law enforcement frequencies DOES NOT include scanners. A tranceiver that can scan is a piece of amateur radio equipment, and therefore exempt. Scanners are not considered amateur radio equipment, and are not exempt. Both the FCC and the ARRL have stated this publicly.

I don't really know of a way to make this more understandable. I'm sorry if this does not fit what *YOU* think should be, but I'm just reporting it, not making the rules.

SJ> capabilities.

I think Jim was asking why the PL Tone decoder wasn't included as part of
the scanner. An optional decoder is fine, but it's just not included. It
wouldn't be asking too much, IMO, for manufacturers to include such
capabilities right on the main board.

Any scanner that will handle the number of channels and the freqs you want
will work.
Advice: use headphones to block out the noise as much as possible. Use
Alkaline batteries instead of rechargeables for the (much) longer life
without recharging.

>e-mail me? Thanks!
>
>Mike
>

The DPD air units _usually_ use the frequency for the district they
are covering. The Units' names have recently changed, also.
Formerly Air East, Air West, I have heard them ID themselves as
Air 6, Air 8, Etc, per the district they are serving at the time
(or so it appears). I hear district 6 and 8 on 453.250 (the
dispatch/repeater) and also direct on 458.250. The direct freq
is handy when Radio decides to kill the repeat function for
various reasons.

From: jw@alpha1.csd.uwm.edu
Message-ID: <3ql883$num@uwm.edu>
Source record: 254847

After thursday's practice session this is all I heard:

464.500 driver/pit unknown driver, heavy accent, listed as
a safety freq!

457.0125 Race Control "the track will close for a one hour lunch
at 1:30pm" also listed as a scrambled
penske freq.

That's it! Scanned 461-470 in small chunks and out of 100 pre-programmed
channels that's all I heard trackside.

Try-try again.

Does the Bearcat have a gap between 512 MHz and 760 MHz. I also bought the Pro-26 and found no gap in that range but I read about the gap in the Bearcat. I got my 26 for $329.99 due to a price break at a local ham fest. I really enjoy the Pro-26, so much so that I talked a friend into buying one. He enjoys it too. Happy scanning.

Hello

Here's some web sites which I got about a month ago.

http://www.demon.co.uk/lowe/index/html - Lowe Electronics
http://usis.com/~odium/ - Scanner stuff
http://www.cs.nmsu.edu/thharrel/ - Scanner stuff

I have loads which I could give you but these look like that they could be
general but If you know what you want to find out please let me know and
their might be a suitable site on my list.

Good luck

Yes the GRE 9001 for base units is available from Grove for ~$85 + S&H.
Grove = 1-800-438-8155.

Also available from CRB Research ... don't have their address or phone
number.

4282. Scanner Freqs in North Georgia

Newsgroup: rec.radio.scanner
Date: 1995-06-01 00:00:00 UTC
From: rheld@tcomeng.com
Message-ID: <3qlplv$164h@tcomeng.tcomeng.com>
Source record: 254858

Hope this is not the wrong newsgroup, but:

Can anyone out there tell me what scanner freqs are used in North
Georgia, around Dillard specifically. It IS in the middle of nowhere.

Thanks very much!

Rick Held

You know, it's not often that you see someone offering for sale, in a nationwide (worldwide, actually) public forum, equipment that is described as being useful for committing federal offenses. Even less often do you see someone favorably responding, announcing his intention to buy said equipment and commit said offenses.

Unless, of course, you read Usenet. Then you see it daily.

4284. Re: Detroit Police Air Units

Newsgroup: rec.radio.scanner
Date: 1995-06-01 00:00:00 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <3qje13$9uk@umcc.umcc.umich.edu>
Source record: 254860

I occasionally hear DPD Air units on 123.050 (a standard helo channel), & used to hear them talking to their base at Detroit City Airport on that freq. I haven't heard them talking to their base on that freq in a while, so they might have moved to a more discrete one.

Otherwise, their helos seem to use whatever standard, 453MHz DPD channel they're needed on, and 155.865 (MEPSS) when they're working with other agencies.

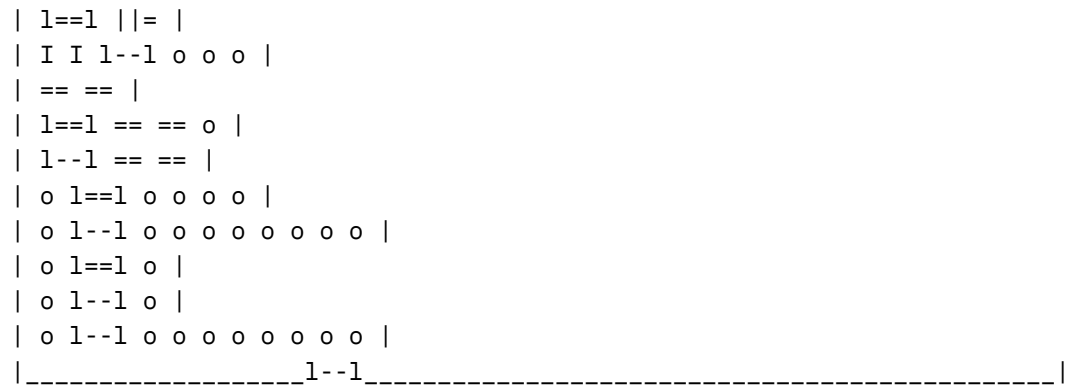
My Pro-2032 doesn't look like this schematic! Here's what I see inside:

```
------------------------------------------------------------------------
| ---------- |
| lGRE9108al |
| lCTD1 2d l |
| l________l |
| l==l __||= |
```



What gives? I see the diode I'm supposed to remove, but where would I put the 1N914/1N4148?

Someone! Please help!

: Contrary to what they show on TV, few agencies have terminals in
: their vehicles. Everything is transmitted by voice.

here in the Phoenix area, most Cities (Phoenix, Tempe, Mesa, Scottsdale, Glendale) have MDT's installed in many police vehicles. The DPS or Highway patrol also is now using them.

All agencies will only encript sensitive communications like certain stake outs or when there's something they don't want the media to know about. Even then, some of this `sensitive' information may be exchanged via cellular phone (which can easily be monitored) or the MDT system.

: > tap wire line phones!!! JOHN

: Yeah, for the cops. Criminals cap tap with ease, and, I'd worry about
: them much more.

Many criminals have had their crime spree ended by bragging about it on a cordles phone. Someone robbed an armored car and killed driver. his undoing was talking about the crime on a cordless phone.

get a scrambler from SPY HEADQUARTERS. if you really want your cordless phone conversations to be private. Anyway, it's a bit of trouble to tap a wireline phone. first, you need to find the phone box, next you need to locate the correct pair that carries the conversation you are interested in, finally you either need to remain there and listen or find a way of remotely listening. With a cordless, you simply turn on a scanner and search.

So if a baby room monitor, 49 mhz FM transmitter, Etc.,Etc.,that has a 5 channel selector how can this prevent from people picking up cordless. Since the hand set transmit on 49mhz.

New laws brings attention to the matter. Found out the the reason the made cordless illegal is that cellular phone manufatures have these new cordless/cellular phones. These phones allow you to use your home line with in the range after you step out of the range the phone automatically change to a cellular system.

The cellular companies brought up this new law to protect {ha ha ha} these new phones from being heard.

This law makes every joe dick and harry know about. they just need to leave it alone.

Scott,

Pick up a BC 3000. It has double the number of channels of the 26 plus it recieves cellular LOUD and CLEAR. I also hear the 26 is not as immune to interference as the 3000.

Get the 3000!

Ch.D12 460.3250 (465.3250) Citywide 1 (CID & Emergency) KLG615 127.3
Notes: MPD units who do not patrol a particular patrol district, such
as those from CID, Traffic, SOD, among others, typically operate on
the Citywide 1 Channel. These units often use 460.275 (if available)
or 460.45 for unit to unit (tactical) conversations. SOD units remain
on Citywide 1, unless working a detail on the SOD Channel. Federal
users such as the US Marshals, DEA, and Crown, have been noted using
Citywide 1.
Simulcasted throughout the Metrorail Tunnels and onto the VHF
Band, Citywide 1 serves as MPD's emergency frequency. As in the case
of the MX340-s radios, Citywide 1 is typically a channel easily
selected for emergency use (all modes A through D are repeater for
that reason).
The Command Channel, 460.425, routinely used by the MPD radio
shop, is also the unit to unit (tactical) channel used by high ranked
MPD officers bearing the coveted chrome plated MX340-S radio. The
Command Channel is primarily used during special events for messages
of a priority nature. Restricted use of this channel by units other
than the radio shop, assures it is available for a priority
conversation.
As the phase-in of the Saber continues, the 4th & 5th Districts
who use 460.1 as their MX340-s Tac channel, are now given 460.45 as
their Saber Tac channel. Besides being used for unit to unit
(tactical) communications, the "B" Tac channels serve other purposes.
Various offices, and details, such as the ROPe, SID, individual

patrol district offices, and others, frequently operate on these "B" (tactical) channels.
At one time, some consideration was given to an eighth police district on Capitol Hill. As a result, position eight on the MX340-S was allocated for this district which never materialized. Ch.A8 is currently known as the "Station Channel" since conversations between officers in the field, and the stations (or dispatchers) frequently take place here.
"D" channels are used for messages of a confidential, surveillance or personal nature by portable & mobile units only. It's not uncommon for a particular district to use its "D" channel in other districts or even in the suburbs. FCC Rules Part 90.19.(G)(3) allow for these low power, unlicensed "D" channels. Various MPD protection details, such as the Mayor's Detail, frequently operate on one of the "D" channels. The typical MX340-S (assigned to a patrol district) will only have its own "D" channel & none other. However, special capability is granted to those high level officers that possess a chrome plated MX340-S radio. The frequency commonly used by the SOD ERT units, 465.0, is actually a business paging allocation. At times, adjacent districts are simulcasted together so as to reduce the number of necessary dispatchers (Citywide 1 & 1, 2 & 3, 4 & 5, 6 & 7). See the end notes for additional MPD related material.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

If you are interested in purchasing FCC data, you might want to consider forming a co-op of people in your area to share the cost. As far as I can tell, this is legal since the information is in the public domain. However, the software supplied to view or manipulate the data is usually copyrighted and must be purchased separately by each user.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $103, and the mapping version is $173.

Floppies are available by state for $43 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. The US Index CD also covers the entire US but comes with a more powerful database manager. Regional CDs cover subsets of the US but provide more detail about each license. Finally, the mother of all databases is the seven-CD Frequency Set, with data organized by frequency.

Spectrum costs $37, the US Index is $87, regional CDs are $107 each ($465 for the complete five-disc set), and the Frequency Set is $1515. Data is updated quarterly (the latest data is from Nov 94). PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), or Pergrim@aol.com (email).

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates sells a PC-based database program called the FCC Frequency Retrieval System V2.x. It comes with FCC data for one state, covering all services and all frequencies. Data is updated approximately | every six months (last update was Dec 94).

Cost is $35 for the first state and $20 for each additional state. Updates cost $30 per state. (Add $5 for CA, FL, TX, NY.) Quantity discounts

available. Fully working shareware copy downloadable from their BBS at 206-871-4228 (FCC200.ZIP). ScanWare Associates can be reached at 206-698-1383 (voice) or 206-698-8207 (fax).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL radio services between 30 MHz and 2 GHz. Each volume covers one state and costs between $14 and $29, depending on the state. The volume for California is 820 pages. Contact US Scanner publications at 800-890-6999 (voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

4303. Discones vs Discones & dipole nests

Newsgroup: rec.radio.scanner
Date: 1995-06-01 00:00:00 UTC
From: Andy Dingley <dingbat@codesmth.demon.co.uk>
Message-ID: <801969550snz@codesmth.demon.co.uk>
Source record: 254919

I guess I need a roof-mount antenna, and that sounds like a discone. I'll probably make it myself (I understand a fair bit of radio theory, and I enjoy welding stainless). The question is, and this applies equally well to buying a discone, is whether I shoudl go for a simple discone or for one of those which looks like a cross between a discone and a nest of dipoles sitting atop it. Has anyone any experience of the two ? Does the dipole nest help most with bandspread, general gain, or lobe elevation ?

Usage (for the base antenna) would be airband, and the site is a single storey bungalow in the bottom of a small valley. To get true line-of-sight, I'd need >50' of mast, and I can't quite see that happening !

Or I could buy the fibreglass pole Scanmaster - Anyone tried it ?

Cheer up, at least you can get legit copies of PGP 2.6 in the US ;-)

> so it can't be that hard to unblock the ones in the US.

Not necessarily. We're reaching a point where scanners contain a pretty whizzy single-chip controller and the pressure on the production engineer is to remove as many as possible of those expensive-to-assemble discrete components. Putting my embedded system developer's hat on for a moment, I'd be looking to replace the resistors & diodes that have previously been used to control the various features, and start doing it by changing the programming masks for the controller.

It's quite possible that a generation of scanners in the near future will be such that given a US & a UK spec model sitting on the same bench, and a comprehensively fitted out lab full of electronic geniuses, they *still* won't be able to bring a US spec up to a UK spec, except by removing an essential component of the UK model. If I really felt the need, I could already design a pretty much unbreakable system like this.

This may already have happened 8-(

I am looking for old police call books from 1984 back to the beginning
1976?? I will pay shipping and a reasonable fee per book if they are
in decent shape (readable, that is).

4306. Scanners For Auto Racing?

Newsgroup: rec.radio.scanner
Date: 1995-06-01 00:00:00 UTC
From: stoffel@oasys.dt.navy.mil
Message-ID: <stoffel-0106950819200001@dtnet44-41.dt.navy.mil>
Source record: 254922

Hi,

I'm sorry if this is an FAQ. I looked for one but couldn't find it. If there is one I would appreciate directions.

I am looking for a portable scanner that will perform well at auto race tracks. The environment there is often characterized by high temp.'s and high background acoustic levels. If possible, I would like to be able to hear transmissions even during green flag racing (which can be VERY loud).

Most frequencies (at least for NASCAR) appear to be in approx. the 450-470 MHz range, although there appear to be a couple around 855. If possible I would like to have a scanner which I could program for at least 50 specific frequencies in that range. If possible I would like to be able to use it for at least 8 hours without having to change or recharge batteries.

Is there a portable scanner(s) which will do a decent job in this service? Any help suggestions would be appreciated. Please respond by whatever method is most convenient for you.

Thanks - Bill

Dave,

If I'm correct, you're listening to the 800mhz trunked radio systems,
which are computer controlled. The computer switches the tranceivers in
pair to different frequenicies automatically to prevent monitoring. If
your scanner receives 800-mhz freqs but you lose the signal during a
transmission, I suspect that they switched on you, not the other way
around...

Message-ID: <3qkj9j$gbr@transfer.stratus.com>
Source record: 254925

I have a Radio Shack Pro-34 Scanner for sale.
The PRO-34 has 200 channels and covers 30 to 960 Mhz.
The PRO-34 does not cover the FM Broadcast band and cell phones. As you know the PRO-34 can have an 800 Mhz. mod done but this one is clean (no mod). This Pro-34 is in good working condition and comes with the wall charger/eliminator,less Nicads. This PRO-34 goes to the first reply with $125 plus shipping from MA !

4310. Any Scanner Web Sites?

I had lots of problems with a recently purchased AOR AR1500 and
the dealer said that it would need to be shipped back to Japan
to be fixed. Anyways, to make a long story short, they're
giving me an AR2700 as a replacement!

I read some info about the AR2700 on the Javiation (I think
that's the company) Web site and it sounds like a *huge*
improvement! I was wondering if somebody could give me
an unbiased opinion on the 2700. Is it as wonderful as
it sounds?

Thanks!

I've purchased heavy duty Velcro at the local Radio Shack store, placed one half on the back of the pro 43 near the top and the bottom and the the other half in sapcing that mates the back of the scanner on the dashboard. Works great. Just make certain that the glue has dried suffciently to hold the radio and that the Velcro pieces are in good shape without dirt, dust or debris. You might consider an external speaker mounted somewhere near your head (a small one) to cut down on road noise and distortion (a small external amp helps)

Mark In one word .

YES
You will give up sideband via BFO.
But everything else is much better than the old 1000 and 1500.

Tho I am a dealer for AOR and Uniden you WILL like the 2700.

Jeff

sorry that I don't ahve the answer for you re: El Lay Traffic copeters
and broadcast media freqs. This is, as you suspect, very interesting stuff to
listen to. Ironically, one of the less well known provisions of the ECPA
forbids listening to these frequencies - just as it does cell phones. So much
for the news medai's dedication to free access to info, eh? Seems they all are
afraid another station will get a tip from their stuff and ruin their "scoop".
Not that I listen to this stuff.... but it (the legislation) wouldn't stop me
if I WERE inclined to do so.

I own a 1991 VW Jetta, do all sorts or hard cornering and stuff :) I bought
a goose neck mount and a universal cellular phone holder. Basically it's
a fancy clamp that holds on to the phone. I use a Sinclabs VHF antenna on
it. It's very flexible and is very sensitive to the local police VHF freqs.

4324. Pro 2032 Mod?

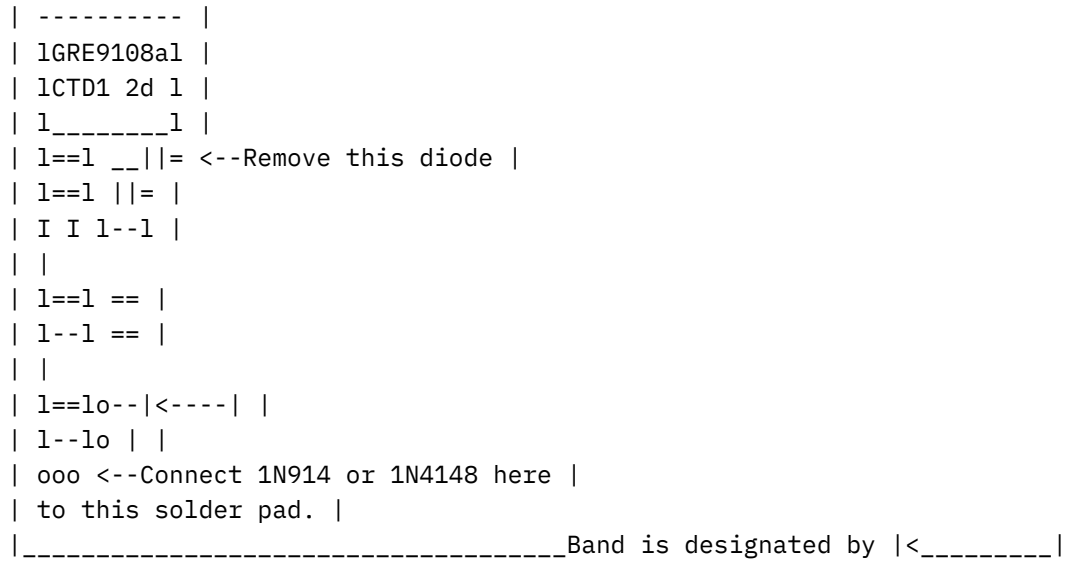
Newsgroup: rec.radio.scanner
Date: 1995-06-02 00:00:00 UTC
From: jls <jls@sierra.net>
Message-ID: <3qlkua$dnm@jobes.sierra.net>
Source record: 254781

Hello All,

I have this modification listed for the Pro 2032 but I can't figure
out for the life of me where to solder the diode. Can anyone give
me a little more specific instructions as to where to solder this?

This is what I have:

Required equipment...small-tip soldering iron, small gauge rosin core
solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower
covers (foru screws in the rear of the cabinet), taking care not to damage
the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the
microprocessor shield (upper left corner near volume and squelch controls).
Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower
right of the microprocessor chip. Carefully unsosolder and remove this
diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown. (NOTE POLARITY) Remove any excess leads
and carefully solder it in place. Be sure it's leads will not contact any
other components, paths or the reassembled shield. A small piece of tape
may be used as insulation if necessary.
5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.



Thanks, e-mail me direct or just post a follow-up here.

Just wondering if anyone has an updated frequency listing for the drivers on this year's NASCAR Featherlite Modified Tour? My latest is from last year, and there have been several changes...

Please e-mail me with any available info.

Thanx!

Not sure what it is , repeater I think, but I mosly listen to 159.150
for DC police. I here dispatch, officers to dispatch, car to car. I
do have one question about this frequency though. Why is it more than
one person can be talking at the same time and they can hear each
other. I have heard officers interupt the dispatcher many times and
the dispatcher can hear them while still talking...

I had a Pro-26 for 2 weeks and it croaked. I brought it back and
got a BC3000XLT instead. I am much happier with the BC3000XLT than
with the Pro-26. There are only a few advantages that the Pro-26
has over the BC3000XLT:

Smaller size
Direct Search Mode
Takes standard AA batteries.

Other than that, the BC3000XLT comes out ahead for the most part.
Overall I find the BC3000XLT feature set superior (especially
the 200 extra channels and better sensitivity on VHF-Lo).

Good ole' Newt Gingrich recently said we don't need the FCC, just sell the
frequency to whoever wants to buy it. Imagine the chaos that would cause,
the above ad would be icing on the cake. Maybe we need a little chaos to
get the FCC the support and financing it needs, once we get rid of the
industrial lobbyists, that is, and put the public's interest first.

You're not the only one that has noticed the resemblance. Dad was sitting in a library once and saw a Time magazine with Fred Roger's picture on the front and said "I wonder what they put ME on there for?"

Thought you'd like that...

In response to the objectivity of the reviews in MT, MT did in-house reviews because they are a lot less expensive to do. However, with the ever-growing popularity of MT as a diverse source of information, we decided to pay the extra money to get out-of-house writers to maintain the objectivity. Thanks for noticing!

From: sgray@news-server
Message-ID: <3qn7v1$12q@misc1.microserve.net>
Source record: 254794

I am selling my Icom 2SRA 2 meter transceiver / wideband receiver. The rig features a full 2 meter ham transceiver and a separate wideband receiver covering 25 to 950 mHz, with *no* deletion of the cellular phone band. The transceiver and wideband receiver can operate simultaneously to provide dual band receive capability.

This rig is no longer sold in the USA because of the ban on rigs that can receive the cellular phone band.

The rig is in excellent condition, and includes the original box, manuals, and the following accessories:

BP-90 AA battery case
CP-13 Cigarette lighter cable w/ filter
LC-73 Leather case
OPC-288 Mini DC power cord

I am selling the rig because I am no longer commuting between New York City and Central Pennsylvania every weekend (it was a great traveling companion).

Price: $395, plus shipping.

Thanks!

>
>Thanks very much
>Dave

No mod is available since the 210XL does not receive the 800MHz band. A GRE
superconverter would do the trick if you could still find one.

From: forsberg@cts.com
Message-ID: <D9Iz9D.2rE@crash.cts.com>
Source record: 254803

I have written a Windows 3.1 program that will decode the Telemetry from the DOVE amateur radio satellite. The DOVE satellite transmits on a frequency of 145.825. Since it only makes about 2 passes a day and each pass is about 10 minutes, you will need a satellite tracker to determine when it is present. My program will with a Packet TNC decode the telemetry data. It is available on the internet via FTP at oakland.oak.edu in directory /pub/hamradio/pc/satellite as dovedv12.zip. If you do not have ftp access via the internet then you can receive it from me for $1 in USA or Canada and I will supply disk, mailer, and postage. Please specify disk size.

Bill,

THere are many scanners that you could use. I would recommend a triple conversion scanner to eliminate interference from other frequencies. There is no scanner that I know of that will work for 8 hours without new batteries/re-charging. You will have to carry extra batteries. There are alot of factors that effect battery life, and therefore it cannot be acurately predicted. The following are good scanners:

1. BC3000XLT about $375.00 (you must buy an extra battery pack)
2. RS PRO-43 about $200.00 used

If this is out of your budget, go for a dual conversion scanner such as a Bearcat 220XLT, or BC200XLT, or a used RS PRO-51.

: Thanks for the post. I have an R7000 that does the same thing. Never
: have had time to look into it. Whine lasts only about 15 minutes and
: then once its warmed up its OK. ICOM may have a service note on this.
: If you find out anything please let me know.

: Thanks Bruce forsberg@cts.com

The high pitched wine comes from a DC/DC convertor in the Receiver.
In this convertor there are electrolyte capacitors which dry out.

Greetings R. Schneider

Sa> Physicians radio network...). Yes you need a subcarrier receiver.

In many communications books, there is a simple circuit that you can
build that will enable you to receive these subcarrier transmissions.
Then, connect to an earphone jack on one side and an amplifier on the
other. The receiver used to use with the circuit should be a hi-fidelity
receiver.

Actually, they already answered back when the ECPA was passed. See, the
2004 was the first base scanner that RS made that had 800 Mhz capability.
Well, when the ECPA was passed, the 2004 was delayed. Why? Because they
had to add a glass diode on the finished product to block the cellular
band.

I have been wondering this myself for years. But when I really think
about it, there is only one frequency that I monitor that would benefit the
use of a PL decoder. (speaking about handhelds here.)

Uniden Bearcat does offer an optional PL decoder on some of their line of
base scanners.

Subject: Re: Pro-43 Case

There is no better case for your PRO-43/39/44 available:

FROM: Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

I now have limited supplies of custom-designed, hand-made
leather cases for the Radio Shack PRO-39, PRO-43, and
PRO-44 handheld scanners.

The case is handmade out of fine, black, Corinthian leather
(ok, I'm kidding about the Corinthian part) and fits snugly
on the PRO-39/43/44. The case has cutouts for the display,
the keyboard, and the power ports. It also has sound
holes over the speaker.

The scanner slips into the case without having to put the
belt clip through a slot. The case is designed to stay on
the scanner all the time, so, to that end, there is a
velcroed flap at the bottom that allows you to open the
battery compartment and change the batteries without ever
having to take the case off. There are also slots in the
back of the case if you want to loop your belt through it
for greater security.

With a little "training" the scanner in the case will stand up
on end without any problem.

The cost of the case is $29.95 plus $2.00 S&H. If you're in
California, you'll need to add $2.47 state sales tax (sorry).
Since the cases are handmade, it may take as long as 3-4 weeks
from receipt of your check or money order. I will try to speed
this up as much as I can. The cases are sent out via airmail
and satisfaction is guaranteed.

To order, send a check or money order to:

Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

You can reach me by phone at 415-328-9181 afternoons PST or via
CompuServe Email (ID:76174,637.) If you are ordering from

outside the US, please drop me email, because the postage will
be a bit more. Feel free to contact me if you have other
questions about the case, and thanks very much for your interest.

Regards,
Howard

Sure, it'll work.
You need to find the line that activates the circuit that powers the EL Panel that lights the display now, and use that to power the LEDs. Then, remove the EL Panel, and replace ot with a frosted glass/plastic panel , and find a way to mount a mirror behind that. Should work fine.
All this is actually able to be done, but the results may be less than acceptable. More than one LED would be needed (no real problem). It's getting a smooth light that's a bear.

Lee, I think we agree here. Perhaps I should have been less terse in my
assessment of MT. By observing that MT had extra "baggage" I meant that
its association with a dealer makes it harder to be objective. I do think,
though, that they are trying hard to do so.

The tiny antenna is probably the biggest reason.

The 9V battery is limited in its ability to provide high current. I'd
start with something safe. Construct a pack of six AA cells to provide 9V
with more "oomph" and see if it carries farther.

Don't go over voltage; Gunn diodes are 8V devices and you'll probbaly burn
it out if you go too high.

Herr Braun:

The address of Ramsey Electronics is 793 Canning Parkway, Victor, New York
14564, U.S.A. Phone 716-924-4560. Credit card orders at 1-800-446-2295.

Unless you are fairly adept electronically, I would suggest ordering the
SS-70WT....the WT just means "wired & tested". The SS-70 kit is $40; the
case kit is $15; the fully assembled kit and case is $80.

The set-up works great and it descrambles all sort of common speech
inversion, "duck-talk" and otherwise unintelligible speech transmission.
Of course,it will not descramble digital/high-tech scrambling.

Tim,

Scanners are perfectly legal in New York and New Jersey provided that it is not installed in a motor vehicle unless you're a firefighter, peace/police officer, working press or licensed radio ham operator.

If you keep your scanner in your home you can enjoy it to your hearts content.

Yes you can easily listen to New York City's Fire Department (VHF-high band) and perphaps the police dept. (UHF).

Get a good scanner and have fun listening to local events and action.

You may want to try a product call photoloc available at most large camera stores. It's really strong stuff better than Radio Shack's. I've used it to mount different equipment including an older Regency HX-1000 on a car's dashboard and it held up without falling off. It's not cheap but well worht it.

>: radio network...). Yes you need a subcarrier receiver.

PRN (Physicians Radio Network) went out of business several years ago.
Most of the SCA activity here in the NYC area is ethnic/foreign language
programming, and various types of data transmission. MUZAK has dropped the
majority of its SCA distrivution in favor of V-SAT dishes installed on-site
at subscribers' business establishments.

These folks repaired my BC200XLT and I can vouch for their service.
Unfortunately, they were swamped last summer due to positive articles in
RCMA Scanner Journal and Monitoring Times, so it took *for*ever.

Sounds like the BC100XLT (The BC100 had 16 channels and the BC100XL had
20). Uniden might have the manuals, but if they are like the BC200XLT's
manual, you're not missing much.

To search a range:

1 - enter lower freq, hit LIMIT
2 - enter higher freq, hit LIMIT
3 - hit SEARCH to search between limits
4 - hit HOLD to stop searching
5 - LIMIT (down) and HOLD (up) may be used to step through frequencies

Note that mode and steps are dictated by range to be searched.

VHF-Lo, VHF-Hi - FM , 5 Khz
VHF-Air - AM, 25 kHz
UHF - FM, 12.5 kHz

Grundig YB-500 - 1

I was looking at the Grundig Yacht Boy 500 recently because of its having RDS - I suspect that the RDS on the Satellit 700 is similar / identical. It has a diagnostic feature where you key something like 1-2-3-4-5 before switch on. It then will read various details of the RDS - like PI, TA, TP and also the RDS "quality".

But it does not use any of these features. It displays the PS - station name - but I am not sure if it uses the AF automatic retuning of RDS. It display the Travel News flags TA & TP in diagnostic but does not use it at all.

There is a clock on the radio but it is not updated from the RDS CT clock. Its a great pity that a bit more thought had not been put into the design. Incidentally this diagnostic function is present on some car radios, usually needs a series of key presses to get into the mode.

I ended up getting the new Sony RDS radio - its not a SW radio just VHF/MW/LW I was quite disappointed with the design of that also and wrote to Sony in Japan - they confirmed my suspicion that it was designed in Japan where they have no RDS !

It does update its clock from CT though. Also uses the TA/TP flags to allow you to get Travel News from another channel.

They do not have fully automatic returning using AF but you push a button to step through the various Alternative Frequencies.

I was most disappointed by its not fully using EON (Enhanced Other Networks), it has it so that it can retune to another station for Travel News. But I was hoping that I would be able to tune one memory to BBC Radio 2 in a new town and the other 4 memories would be loaded with the local frequencies for Radio 1, 3, 4 etc using EON. But it doesn't.

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home

(no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening because it was the cheapest thing at Radio Shack. I think I paid $60 for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the price, but not too great. When I'm at home (western US) I can pick up the major international broadcasters, but no too much else. On my trips back East, I've found sensitivity picks up some, but it's still only fair.

Performance on the AM and FM bands is average, but longwave seems to be nearly useless. I've never heard any nav beacons on this one, even though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these up when I bought my radio. It helps reception a little, but not very much. A much better solution is to wrap a stripped end of a wire around the the whip antenna, and attach the other end to a metal windowframe. I've tried connecting my longwire to it, but that just overloads the receiver (not surprising).

One major problem that I've noted is that the dial markings on some shortwave bands seem to be off by up to 10 kHz. If you know about it, it's not much of a problem to work around, but initially it could be quite confusing.

Overall, this receiver is average for its price. There's no real surprises, either good or bad. If you really want an inexpensive radio, go for this one. Otherwise, I would advise saving your money and going for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a rebate. For the price I think I got a good deal. It has digital tuning and direct input of frequencies which allows tuning to be a pretty simple job and not a time consuming act of patience. It uses two C type batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it' soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify this. I bought it on sale from Radio Shack for the bargain price of $129.95! It regularly retails for $179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380 is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even better! I read another review that said reception was lousy....I think that individual should check his particular receiver as he might have the rare defective unit. MW reception is also outstanding and with a Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the select-a-tenna! With the S-A-T reception gets an added boost! (these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like something smaller, like the 606. This size, however is fine. I've carried hardbound books on jets that are larger. The many features makes up for it's slightly larger size over a mini. It does not have SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought it for the price of $179.95. There are other radios in that price range that ive ya more bang for the buck. At $130.00, it's a great deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some of my experiences. First of all, I would pay the extra to get the

390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making

this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it.
I miss the 512 memories of 700 and 'SSB clarify' control
sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However,
it is rather simple to make it work similarly to '700 and '2010,
because the detector chip is the same in all three. Only a switch
with two pairs of contacts is needed. Another design fault, the
excessive distortion in SSB mode, can be partly cured by adding
two resistors. For serious DX-ers it may be important that the
internal ferrite rod cannot be disabled on MW and LW in both 500
and 700, so the in-house noise may become a problem on these
bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise.
Similar number of cubic inches as the Sony (different shape), but
offering some features of the R8. Also the Lowe is made with a
mostly solid alumnum case, which is better than the Sony or the
Drake. The Lowe has dual antenna inputs (wire or SO-239), record
out, audio out, 12vDC in. It can run off any 12V DC battery.
I use 7 aH gelcells which I recharge. The Lowe also takes
8 internal AA nicads *OR* disposable batteries. It will recharge
the nicads with a builtin recharger if you plug it into
an external power supply. It's a nice semi-portable radio. It
has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with
it. I use it mainly for broadcast listening. It's connected to
25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial
and the coax, and on some frequencies it gave a (small)
improvement in signal strength, but it was such a pain to keep
retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to
offer the best of both worlds - improved matching between the
wire and the coax, but no retuning necessary. It's rather
expensive, though, and it may be that I'd have been just as well
off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong
signals well away from where you're listening, seems to be

completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable
for under $200. However, I accidentally crossed paths with a
Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a
local store and had to check it out. It is an analogue set, but
since I got a 30-day return policy on it, what the heck? Good
points: analogue tuning so no problem with confining 5kHz
tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK
and Sangean away with the number of stations I picked up, good
selectivity (no fine tuning knob - all you need to do is turn
the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small
whip antenna (only 18"), addition of Radio Shack rollup
longwire increased sensitivity even more, great low price (if I
lose it or its gets destroyed, no problem replacing it), tuning
bands are wider than the major broadcast bands, so you do get
some utilitiy reception as well as WWV, AM and FM are really
sensitive while FM goes from 76mHz to 108mHz so I can pick up
some TV as well. Bad points: frequencies cover only seven
broadcast bands (I can live with that, though), only monaural
earphone included (however, you can get a $1.39 mono to stereo
headphone plug), no BFO for SSB or CW, no station memories. All
in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband

filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S is an amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is produce when a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the
received signal is strong to begin with. Don't waste your money on
the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the
serious DXer but it has some shortcomings. The 535 is much better
than the Icom R-70 that i had before, and i would recommend it to
anyone that asked me. What you might want to do is change the filters
to somewhat sharper filters. That goes for both the 9 MHz and the
455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external
speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now
that I've said that, you should know that I am new to all of this "DX-ing" (is
that how you say it?). However, I can tell you that it's reception with the
built-in antenna and with the included auxiliary antenna is very good. I found
that the radio comes pre-programmed with a number of stations (BBC, Radio
Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high
quality, delivering plenty of volume and good sound. There are several "tone"
switches (news vs. music setting, etc.) that enhance the reception and its
sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to
other radios since I didn't comparison shop). There are several output jacks
that make it easy to connect to external speakers, tape recorders, headphones,

etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position

Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM (SAM) detection in my HF-1000 receiver. I was able to install it in about 1/2 hour and it worked great. In testing it I compared it to the

ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter ESKA+NRD HF-1000+SAM
--------- -------- -----------
Weak signal lock range +- 20 Hz +-250 Hz
Strong sig lock range +- 40 Hz +-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1

My general impression, is that this is anyhow a very good apparate. It
offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing,
quite good operating commands, triple conversion, 400 memories; it is
very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected
front-end band filters reduce to some extent unavoidable intermodulation. In
general, this set offers a self contained and very well balanced compromise
of a lot of different demanding features, but will show its best when fully
interfaced.

Its price, here in Italy, has been varying greatly during the years.
Therefore I cannot say how it really competes with the choice of HF
receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.

The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories
.
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

Nope. US v Silverthorne applies to the actions of law enforcement officers, not private citizens. Under Federal law (amplified by USSC decisions), the trial court would have to assess the "totality of the circumstances" to determine whether the informant tip provided enough cause for the agency to act. An anonymous tip, combined with actual surveillance to validate the tip, should be "probable cause" for a search warrant or an arrest. Once one of those things happens, the fact that the original information came from a scanner enthusiast's tip becomes irrelevant to the case.

What about installing an antenna.....and whats the deasl with the NoTenna by Grove that you use in your car. I guess you hook up the center coax to the chassis of the car on a screw (like the one holding your visor) and it works??? does it?? Joewo@aol.com

4392. Police/Fire Dept monitoring

Newsgroup: rec.radio.scanner
Date: 1995-06-03 00:00:00 UTC
From: thyatt@haven.ios.com
Message-ID: <3qq6l7$qt6@ankh.iia.org>
Source record: 254753

Hello, everyone.

I live in New Jersey, just across the Hudson River from Manhattan.
I'm interested in obtaining a scanner that will allow me to monitor
activity in Manhattan. I don't know anything about scanners,
unfortunately. Are scanners that monitor police/fire department
frequencies legally available? Do you think I would be able to pick up
police and fire department transmissions from Manhattan?

Thanks.

Tim

4393. Uniden Scanner

Ok, I have more information on the scanner my friend is
interested in.

He wants to know if the Uniden
Sportscat is a good handheld scanner (150BEWB is the model
number)>

He also wants a recommendation on the BC350A 50 channel
Uniden turboscanner.

Post or e-mail your replies.

Thanks!

Gary

Tim, ABSOLUTELY!!

I live in northern jersey and envy your location. Just about any
scanner you buy will do exactly what you are looking for and more.

When you buy your scanner be sure to pick up a publication like
'Police Call' that covers Manhatten'. You can get everything you
need at Radio Shack. As far as portables go I can reccomend the
Pro-62 handheld at Radio Shack. For a base unit you should check
out the Pro2035 at Radio Shack or better yet the Uniden Bearcat
BCXLT9000 (Not at Radio Shack). These base units are around $400. The
Pro-62 is $219 on sale. You do not have to spend this much to get
a scanner you will be happy with. You can spend around $200 for a
base scanner and do fine. Make sure that whatever you buy covers the
800 mhz range.

Remmember that if you plan to use the scanner in your car that it
IS legal in NJ and ILLEGAL in NY.

Have Fun!

Frank.

Not in the USA but here in the UK Javiation have had a very informative (I think anyway) web site for some time with information on many of the scanners we can buy here in the UK.

4397. Bad Audio on RS 2006

Newsgroup: rec.radio.scanner
Date: 1995-06-03 00:00:00 UTC
From: tturner@sam.neosoft.com
Message-ID: <tturner.13.0047B71C@sam.neosoft.com>
Source record: 254758

I have just purchased a used RS 2006 scanner. It seems to have very good sensitivity, my only complaint is the audio is not as crisp and clear as I think it should be. I have a RS 2004 and Pro 43, and neither exhibit this symptom. It actually seems worse in the cellular band. At first I thought perhaps the speaker was blown, but this condition exists when plugging in an external speaker or a pair of headphones. Could the audio circuit itself be bad. What about repairs...is sending back to RS the best place for repair, any idea of the cost, flat rate etc? One last question, Is the cellular band Wide FM or Narrow FM. The audio is much cleaner when switched to Wide FM. Any help greatly appreciated.

THANKS!

Terry

4398. HELP WITH RS 2006 audio

Newsgroup: rec.radio.scanner
Date: 1995-06-03 00:00:00 UTC
From: tturner@sam.neosoft.com
Message-ID: <tturner.14.004F4E82@sam.neosoft.com>
Source record: 254759

After posting my last message about the bad audio on my 2006, I opened the case and found that diode D502 AND D503 have both been snipped. My impression was that only D502 should have been cut. What is D503 used for, and will re-soldering it cure my audio problems.

THANKS!

Terry

Need help setting priority channel on the Bearcat BC172XL. Anyone know how?

4400. FS: Trident TR2400 100khz to 2060 Mhz

Newsgroup: rec.radio.scanner
Date: 1995-06-03 00:00:00 UTC
From: Robert Blumenkranz <radiobob>
Message-ID: <3qoas9$bcq@mars.earthlink.net>
Source record: 254761

Coverage 100khz to 2060Mhz
Sensitivity .35 micro volt NFM 1.0 micro volt WFM
Scan speed 25 ch/sec
LCD display
Input 9-13.8 VDC

Only 3 months old! This radio is a beauty. Full Cell coverage! AM,
FM,
SSB,CW WFM NFM. Listen to FM radio stations, TV audio, full coverage
shortwave all bands AM FM & SSB (BFO tuning control for SSB), all
police
and fire channels and full cellular site receive! You will hear all cellular
phone
calls in your area! There is nothing this baby can't hear!
I am selling it because I needed a computer controlled model that I just
purchased. So I don't need 2 radios with the same capabilities. But this one
does everything else you could want in an HT. I will even give you the
original box it came in. There is not a scratch on it and I believe that it is
still
under warrantee. Includes ni-cad batteries antenna & belt clip. All for only
$400. What a deal!
Call me Robert Blumenkranz at 714-671-2009 or send me EMAIL to
radiobob@earthlink.net
**********The first $400 takes it!

4401. Re: Information on Motorola trunked radio systems wanted

>>mark/space frequencies?), *format*, etc. If you have any information
>>on this, let me know. I will summarize and post the replies (assuming
>>I get any) so stay tuned if you're also interested in this info.

TRUNKING HANDSHAKING (TYPE 1)

BASICS

l. Control Channel will transmit outbound signaling
words (OSW) to the radio and receives inbound signaling
words (ISW) from it.

2. Control channel continuously transmit's background
OSW's in the absence of activity in the system. These OSW's
are used for synchronization of the radio and contain no user
information.

3. Radios that are turned on will search through the four
highest frequencies in the trunked channel group until they
find the control channel.

OPERATION

l. PTT key up. Radio will transmit a request for service
(ISW) which is 78 bits long, sent at 3600 BPS (total time =
21.67 msec). This ISW is sent in a precise time slot (window)
in relation to the controllers OSW and contains:
a. Radio's ID
b. Fleet and Sub fleet of which he is a member.
Only 21 bits are information, the rest being parity for
error detection and correction.

2. The Central Controller puts the request for service in
a queuing condition, and dependent on its priority, will
assign a channel. The quickest a grant for service can be is
approximately 58 msec after reception of ISW.

3. The control channel sends a channel grant 2 times, in
rapid succession. This 84 bit OSW is transmitted at 3600 BPS
and contains:
a. Individual ID of the radio.
b. Fleet/subfleet which is sent to the new channel.
c. Type of call (group/individual).

d. Number of voice channel to be used.

4. The radio decodes the OSW grant and moves to the assigned voice channel. For a group call, all other radios also move to the assigned channel.
a. At the same time that the controller is sending the OSW grant on the control channel, it is also transmitting data on the assigned voice channel called "High Speed Handshake".
b. This data is a 21 bit frame, transmitted at 3600 BPS. Data within the frame consists of sync data, ID information and two parity bits.
c. The radio looks for his HSHS on the voice channel to confirm it has switched to the proper channel

5. The radio will now key up on the assigned channel and transmit 80 msec of high speed acknowledge tone (1800 Hz).

6. The central controller recognizes this acknowledge tone, removes the HSHS from the outbound voice channel and replaces it with an identical sub audible version sent at 150 BPS and low deviation. This is called "Low-Speed Handshake".

7. At this time, three optional "talk permit" tones are received by the user, the radio's mic is unmuted and voice transmission commences. The radio will transmit continuous sub audible connect tone (105.88 Hz) to the controller to keep the channel connected.

8. In addition, radios that are sent to the voice channel will also look for the HSHS. If they detect it, they will unmute on the channel after detecting the LSHS signal. Total best case time from requesting PTT to receiving radio 280 msec.

9. During all of the voice communication, the central controller duplicates grants on the control channel (Outbound OSW's) as time permits. If a receiving radio drops out for more than 1 second, it will return to the control channel and be redirected to the assigned voice channel.

TERMINATION OF CALL

1. When the PTT is released, the radio sends 200 msec of disconnect tone (163.64- Hz at low deviation).

2. At this point, the system can be either message or transmission trunked.

a. Message Trunking: The Central Controller detects the disconnect tone and begins a message timeout timer (2-6 seconds). If another radio keys up during this time, the controller will detect this and the timeout timer will be

reset. If no other radio keys up, the timer will timeout and the central controller will disconnect the radios from the channel by sending 125 msec of low speed disconnect sequence (sync patterns at 300 BPS with low deviation) on the voice channel. At this point, the radio will return to the control channel and becomes available for reassignment.

b. Transmission Trunking: In this mode, the central controller will issue a low speed disconnect sequence (same as message) immediately after detecting disconnect tone from the transmitting unit. The radio will remain muted and return to the control channel

>would be great to hear chat from the reporters between broadcasts.

Remote pickup for broadcast radio stations in So Cal would most likely
be:

450.050
450.150
450.250
450.350
450.450
450.550

Each of these freqs is usually paired with another one 5 MHz above. I
believe these would be considered broadcast auxiliaries - which would
make it illegal to monitor.

: CJ> NO! NO! NO! Not so in New York. A scanner is a no no. a ham transciever
: CJ> capabile of recieving police broadcasts in the possession of a licensed
: CJ> ham is OK. NYS DMV laws, check them out.

: Doesn't seem to do much to post this, does it?
: I've been saying for some time now that the FCC rules don't cover scanners,
: and I keep getting mail that tells me that "this or that tranceiver scans,
: and is covered". They don't read what's posted, as far as I can tell.
: So, here it is, for ALL to read:

: The FCC rules making amateur radio equipment exempt from local laws
: banning receivers that can scan/receive law enforcement frequencies
: DOES NOT include scanners. A tranceiver that can scan is a piece of
: amateur radio equipment, and therefore exempt. Scanners are not
: considered amateur radio equipment, and are not exempt. Both the FCC
: and the ARRL have stated this publicly.

: I don't really know of a way to make this more understandable. I'm sorry if
: this does not fit what *YOU* think should be, but I'm just reporting it, not
: making the rules.
: Bill Funk

Note that nothing in the FCC rule eliminates the prospect of a "home built" transceiver. That is...the FCC did not specifically define a transceiver as having to be a commercially manufactured (ICOM, Kenwood, etc.) unit. Therefore, it is quite feasable to take a scanner, mount it in a single case or enclosure with a transmitter (say a fixed channel two meter homebuilt unit) and, therefore, have a homebuilt transciever fully within the FCC protected pre-emption. Such a transciever might be relatively crude in concept and appearance, but it would still be a transceiver by any technical definition...which is worth also noting as the FCC preemption did not include any definition as to what constitued a transceiver for purposes of the preemption.

Would such a home built arrangement ever be challenged by the police? Who knows...but there's certainly ample room for any competent attorney to defend the arrangement if it was ever challenged.

Per this message, this isn't intended as any sort of flame, just that
the laws (FCC or otherwise) can and do often leave much room for
interpretation and until any such law is "tested" it remains to
be seen just where certain boundaries (what is or isn't a transceiver
as intended by the FCC) might actually be defined by the courts.

Paul Opitz (rpo3352@omega) wrote:

: Well, I'm not gonna get myself in trouble by answering this too
: specifically. I am in no position to make a policy statement for Tandy
: Corporation. However, I can say that we fought to keep our prior product
: line on the shelves, unchanged. We lost.

You are avoiding the point - besides not being factual.

Radio Shack embraced the proposed law, without a whimper.

Also, product manufactured prior to April 1994 has never been banned from your shelves - except possibly by company directive. It is true that you have had to remove a couple of products that turned out to be modifiable, which were manufactured/imported after the effective date of the ban.

Radio Shack could probably have made a killing, if they had stocked up on a massive number of PRO-2006s and PRO-43s. Instead, what did they do? They simply let the supply die - even before the ban date.

: You might also consider for a moment the relative profit margins of cell
: phones (a highly competitive market) and scanners. Where do you think
: the profit REALLY is? (Rhetorical question, please...only rhetorical
: answers desired :^])

As the other person stated - the profits are in the cellular phones and activation charge kickbacks.

: MY opinion (not speaking for the company) is that the FCC's measures,
: and Congress's legislation, whether they make sense or not, are like
: throwing teaspoons of water on a stack of burning tires. With thousands
: and thousands of cellular-capable scanners...and even more cordless-capable
: scanners...the recent revisions to ECPA aren't making cellular and
: cordless more secure. If anything, the publicity is making them LESS
: secure. The major tangible effect, I feel, will be in the admissability
: of intercepted conversations in court. Until the changes in the ECPA,
: courts were using the rule of 'reasonable expectation of privacy'. Now,
: however, they have statutory law to follow...

They could have easily done that - without banning scanners. Congress, and the scanner manufacturers/retailers, sold out to the Cellular lobby. It is as simple as that.

Bill

LOS ANGELES CITY FIRE DEPARTMENT WWW HOME PAGE

http://www.ci.la.ca.us/department/LAFD/index.html

Our recent update includes a "virtual visit" to our immensely popular 9-1-1 Communications Center and a *newly added frequency list*. To the best of my knowledge we are the ONLY public safety agency to have openly posted its radio frequencies on the Web.

The Los Angeles City Fire Department is extremely proud to to be supportive of monitoring enthusiasts. Be sure to set a bookmark on our Home Page as we have many improvements planned that you will certainly find of interest.

Your PUBLIC comments (only) are welcome in this forum.

Happy Monitoring!

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

I'd appreciate any information regarding police, fire or other public service frequencies in either West Clare or South Cork areas. I have the frequencies
listed in the "monitor the World" listing, but they do seem to be mostly in the Dublin or surrounding areas.

Many Tnx

KW5A

Easiest? Put it on the seat next to you. ;-)
You could get a cup holder and mount it where you want it, and put the '43
in the cup holder. Works for me. I have mine mounted on the door, so the
antenna's right next to the window.

BS> equipment, and therefore exempt. Scanners are not : considered
BS> amateur radio equipment, and are not exempt. Both the FCC : and
BS> the ARRL have stated this publicly.

BS> : I don't really know of a way to make this more understandable. I'm
BS> sorry if : this does not fit what *YOU* think should be, but I'm just
BS> reporting it, not : making the rules.
BS> : Bill Funk

BS> Note that nothing in the FCC rule eliminates the prospect of a "home
BS> built" transceiver. That is...the FCC did not specifically define a
BS> transceiver as having to be a commercially manufactured (ICOM, Kenwood,
BS> etc.) unit. Therefore, it is quite feasable to take a scanner, mount
BS> it in a single case or enclosure with a transmitter (say a fixed
BS> channel two meter homebuilt unit) and, therefore, have a homebuilt
BS> transciever fully within the FCC protected pre-emption. Such a
BS> transciever might be relatively crude in concept and appearance, but
BS> it would still be a transceiver by any technical definition...which
BS> is worth also noting as the FCC preemption did not include any
BS> definition as to what constitued a transceiver for purposes of
BS> the preemption.

But, then it's not a scanner, is it? It's Amateur Radio equipment, isn't it?
Why are you doing exactly what I said other do? Don't you read well?
Of course what you say is true. Nowhere did I say it wasn't true. In fact, I
said that many people were writing to tell me that amateur radio equipment
that scanns is included under the FCC protection. I said I know that, and
that SCANNERS are not protected. Now you come along, and tell me that
amateur radio equipment is protected.
Did I miss something here?

BS> Would such a home built arrangement ever be challenged by the police?

It shouldn't be, as amateur radio equipment can legally be made from
components by anyone (only license holders can transmit, of course). There
are FCC rules that must be followed, of course, but no certification
procedure (except for certain amps).

BS> Who knows...but there's certainly ample room for any competent attorney
BS> to defend the arrangement if it was ever challenged.

Not needed. See above.

BS> Per this message, this isn't intended as any sort of flame, just that
BS> the laws (FCC or otherwise) can and do often leave much room for
BS> interpretation and until any such law is "tested" it remains to
BS> be seen just where certain boundaries (what is or isn't a transceiver
BS> as intended by the FCC) might actually be defined by the courts.

Nope. The rules are fairly self-evident. It's just that some people seem to
want to make things more difficult than they are. The FCC knows what a
transceiver is: it's a radio receiver and transmitter designed and built to
be in the same case. It's *NOT* a scanner duct-taped to a transmitter.
Why do so many want to make this more difficult than it is?

From: kou@netcom.com
Message-ID: <kouD9MBt1.H9r@netcom.com>
Source record: 254777

I've read that the USGS or the state emergency folks or a university coalition or somesuch has or is working on a quake alert system which reports quakes as they happen, giving you 0-60 seconds until the shaking starts depending on how far you are from the sweet spot. Something like it was jerryrigged up after the Loma Prieta quake of '89 to give rescuers 30 seconds to get off the Cypress freeway structure before incoming aftershocks hit.

They used radio for that, and I'd presume the new system also would so they wouldn't have to deal with network propagation delays. Anyone know anything about it? If it's a tone or a data burst on an otherwise quiet freq it'd be spiffy to pick it up.

Thanks, and pardon the vagaries. SF == San Francisco, not San Fernando or South Florida.

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ
about PRO-43 modifications will be posted every two weeks
until there is demand for its removal. In large part, it is
the file PRO43.MOD from pub/hamradio/mods/tandy at
oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote
its author, it is very complicated, should only be attempted
by someone with moderate to advanced electronics experience,
and is not for the faint of heart or the "weekend technician."
A brief description is included at the end of this FAQ. If
the mod were included in its entirety, the size of the FAQ
would be increased four-fold.

---

2. Which units can be modified for extended frequency
reception?

Note: In the United States, it is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive? Units sold in the US and Canada can be identified by the following scheme

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). [There have been *no* reports of a modifiable 3A4 unit.]

It has been reported that some units currently being made for sale overseas can be modified for extended 800 MHz reception. However, it is not known whether this applies to all overseas units or, if not, whether there is a way to distinguish modifiable units from nonmodifiable units.

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio

(Continued from previous message)

Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they

only remove the diode to unlock the 800 MHz frequencies. When
CSG is mentioned on the net, two types of comments follow:
testimonials from satisfied customers and comments from those
with the technical skills claiming that the service seems high
priced for just removing the diode. But, there have been *no*
reports of shoddy work or damaged radios. (They've modified
two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will
perform the mod for $40 plus shipping. They will move (rather
than just remove) the diode in units that can benefit from it,
but state that there is no way to tell whether the diode
should be moved without looking inside. They claim that the
determination can not be made from the serial number, FCC-ID,
or date of manufacture. For further details, call Grove at
704/837-7081. In order to get a unit modified, a service
order number must be obtained from the same telephone number.
Packages without a SO# will be refused.
---
4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations.

The following procedure requires familiarity with microcircuit soldering and
will violate your warranty. Grove Enterprises assumes no liability resulting
from its attempt, nor will accept the modified scanner for return under any
condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a
desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips
screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully

(Continued from previous message)

unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these

Subject: pro 43 mods

(Continued from previous message)

wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

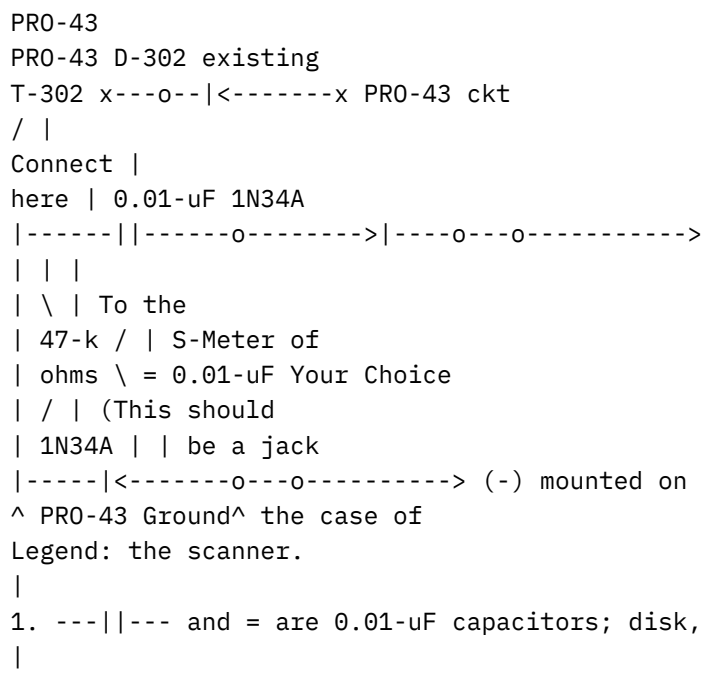
Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of

D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt

the scanner |
|
(-)----------------------------|

You can also build the 10-segment LED S-Meter as shown in Volume 2 of
my SCANNER MODIFICATION HANDBOOK, available from leading mail order
radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research
Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong
transmitter, perhaps a ham transmitter, a police cruiser, your favorite
security guard's handheld or right next to a cordless telephone, or anything
else known to transmit a strong signal. Tune the scanner to the frequency,
and adjust the 5-k trim pot above so the meter reads exactly full scale. All
other signals will read proportionally lower to yield "relative signal
strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94

bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)

: CJ> NO! NO! NO! Not so in New York. A scanner is a no no. a ham transciever
: CJ> capabile of recieving police broadcasts in the possession of a licensed
: CJ> ham is OK. NYS DMV laws, check them out.

: Doesn't seem to do much to post this, does it?
: I've been saying for some time now that the FCC rules don't cover scanners,
: and I keep getting mail that tells me that "this or that tranceiver scans,
: and is covered". They don't read what's posted, as far as I can tell.
: So, here it is, for ALL to read:

: The FCC rules making amateur radio equipment exempt from local laws
: banning receivers that can scan/receive law enforcement frequencies
: DOES NOT include scanners. A tranceiver that can scan is a piece of
: amateur radio equipment, and therefore exempt. Scanners are not
: considered amateur radio equipment, and are not exempt. Both the FCC
: and the ARRL have stated this publicly.

: I don't really know of a way to make this more understandable. I'm sorry if
: this does not fit what *YOU* think should be, but I'm just reporting it, not
: making the rules.

: Bill Funk
: Internet: bill.funk@iotp.com

: ... We now return to our regularly scheduled flame-throwing.
: * Silver Xpress V4.00 SW12853

While the federal rules only seem to cover transceivers, most people have
interirpted them more broadly.
The NYS rules DO indeed have an exemption for Scanners for hams...unless
NY has changedd the rules in the last few years..I DOUBT it!

: re-soldering it cure my audio problems.

: THANKS!

: Terry

Both of them cut is correct-snipping d-503 gives you about a 20% increase
in search/scan seeds(instead of 13/26 it's 15/30)channels per second.

I bought an AR2700 from Javiation a couple of weeks ago. Hunting through the mags I could have saved a few quid on the price (a *very* few quid), but for that I got a long & knowledgable phone call before I bought it, and an informative Web site. Sounds like a good deal to me.

As far as the scanner goes, I'm well pleased. It seems to perform well on every waveband I've used it on (most of them by now) and the squelch is good enough to leave it simultaneously monitoring several different bands all day, without needing to keep fiddle with the levels, or being plagued by false squelch opening. It's a very flexible scanner as step size & AM/NFM/WFM are a free choice for each bank. It's also possible to program multiple channels with widely different frequencies and place them in the same scanning bank - handy for mixed civilian & military airband.

Radio performance is everything you could expect. Sensitivity is good enough for everything I've tried to do, and I've had no problems with spurious images. HF performance is not really something I expect from a device this size - if you want HF, then get a real HF receiver, not an up converter and a VHF receiver.

The manual, like so much imported electronic kit, is terrible. The user interface could also be rather better (IMHO), as some selections are rather counter-intuitive.

I also bought a rubber duck to go with it, a Watson Super Gainer. This is one of the very long thing flexies, rather than a short fat one, and the performance is extremely good for a handheld antenna.

I look forward to rigging up the computer control and linking it to a database. This was really the one thing that swung me to the AOR2700 instead of the Yupiteru 7000.

As I write, I'm sitting in front of 3 electrically noisy PCs and a breadboard full of unshielded microprocessors. The scanner is simultaneously on airband and our baby monitor, using the rubber duck, and I've had no problems with clock signals breaking through.

I'd have no hesitation in recommending either the 2700, or Javiation, to anyone.

I was told snipping the D503 diode would give a scan speed increase
from about 26 channels/sec. to the blistering speed of 30
channels/sec. Every little bit helps.

I have for sale:

B&K 1541B Dual Trace 40 Mhz Scope
Mint cond.
Manual,2 probes,orig. box
20 -30 hours of use
Currently being sold for $895
Asking $500 O.B.O.

Heathkit 50-512Mhz Portable Frequency Counter
Mint cond.
AC/Battery charger with Ni-Cads
Manual
$100 O.B.O.

TeleTester 2 (telephone tester)
DTMF, modulation,ring,pulse,reverse polarity,low&high ring,etc
Manual
excellant cond.
Paid $237
Asking $100 O.B.O.

APPROX. 1000 microfiche cards of various manufacturers of
VCR'S ,TV'S, CORDED&CORDLESS PHONES,ELEC.GAMES,COMPUTERS,
STEREO'S, OFFICE EQUIPMENT, ANSWERING MACHINES, CAR AUDIO,
CAMCORDER'S, ELEC. TOYS, MUSICAL EQUIP., AND MORE.

PANASONIC,RCA,SEARS,SONY,NAP,MAGNAVOX,TOSHIBA,SHARP,LXI,
PHILLIPS,LASER,COMMODORE,FRANKLIN,ZENITH,AND MANY MORE.

COVERING YEARS UP TO 1990(MOST BETWEEN 1980-1990)
$300 FIRM

MICROFICHE VIEWER
Light weight 3-5 lbs
Tabletop model
mint cond.
$100

4447. 900MHz Converters

Newsgroup: rec.radio.scanner
Date: 1995-06-04 00:00:00 UTC
From: Peter Holmes <plholmes@earthlink.net>
Message-ID: <3qt7a1$nkh@mars.earthlink.net>
Source record: 254706
Cross-posted to: rec.radio.scanner,rec.radio.amateur.misc,alt.radio.pirate

I read an article entitled "Listening to Your Dish" by Gary Bourgois.

He discussed FM Squared and a "FM2 converter that will work with your FM radio."

I am looking for information about converters which radio enthusiasts have successfully used to "downconvert" higher frequency transmissions to frequencies within or near 88-108 MHz for use with standard FM radios.

More specifically, can anyone out there point me toward published literature describing converters ("downconverters") which perform a fixed-frequency downconversion of 902-928 MHz signals (or other high frequency transmissions) for receipt and tuning by a standard FM radio?

Such fixed-frequency downconverters are used in some of the wireless speakers and headphones currently sold. Thanks.

plholmes@earthlink.net (Peter L. Holmes)

4449. Want info on PRO-2006

Newsgroup: rec.radio.scanner
Date: 1995-06-04 00:00:00 UTC
From: kbeckman@earth.execpc.com
Message-ID: <3qslva$lv7@homer.alpha.net>
Source record: 254708

Looking for info on the PRO-2006 scanner. I don't need the 800MHz mod, but am looking for the key sequence for changing to 30KHz steps, and any other hidden features that this radio has.

I have the OS456 with this scanner as well. Does anyone have some secrets to share about it???

> be similar, but not quite identical, to the AOR8000.

Yes, you can connect the latest Scout revisions to the AOR AR8000 and
AR2700; receivers with a CI-V interface (e.g. ICOM's R9000, R7100, R7000);
Pro-2005, Pro-2006, and Pro-2035. For this to work with the Pro-20xx
receivers, you must have the appropriate Opto interface (OS456 or OS535).

> Are there any other receivers around like this, other than the Scout ?

No.

Best wishes!
- Erik

Can anyone recomend a good scanner for mobile use? Right now I use a BC200XLT and a Sportcat 150 but when I am driving around, often the transmissions break up and improve only when I stop. Does anyody know of a scanner that doesn't have this type of problem? Thanks.

There is no handheld made that will compete with that sort of racket.
Heck, I don't know of a tabletop scanner with more than a watt or two
of audio powerk nor with more than a 3" speaker.

Think headphones.

You might try the "noisebuster" noise-cancelling earbuds -- they are
surprisingly effective at nulling out low-freq noise (such as the jet
engine noise in a airplane) and allow you to mix in your own audio.
However a lot of the noise you're talking about is in the midrange
where the noisebuster and their ilk only do a so-so job (they do
nothing at all in the highs). Worth a try, though. Especially if you
can get them on a money-back trial basis.

>Get a good scanner and have fun listening to local events and action.

A couple of questions.

1. Define installed. Is a hand held comsidered installed?
2. What is considered working press? I do frelance photo for a magazine and I'm looking at hooking up with AP San Fransico in the near future. Would a California AP photographer in NY be considered working press (I thought about that after the WTC bombing)

BTW, The last time I was in NY (I was born there and go back periodically) I was listening to FDNY on the Fourth of July. I had 4 of the 5 buroughs proggrammed in. I took delay off and left my scanner in scan mode. The Manhatten frequency went non-stop for 2 hours and 13 minutes before there was a break in traffic. Impressive.

Many of the scanner handbooks will list this. Peter Rouse's "Scanners 3"
does it for the UK.

An alternative is to get hold of a Pooley's/Jeppesen/Bottlang flight guide.
This lists everything you might want to know about an airfield, down to
whether they serve coffee or not, and if you need to ask the local farmer to
clear his sheep off the grass strip before making an approach. These guides
are expensive, but as they're published annually you can often acquire last
year's cheaply, either second hand or as old stock.

4457. RS 2006 Off Frequency

Newsgroup: rec.radio.scanner
Date: 1995-06-04 00:00:00 UTC
From: tturner@sam.neosoft.com
Message-ID: <tturner.15.0093CCAC@sam.neosoft.com>
Source record: 254716

Yesterday, I posted a message about my RS 2006 having bad audio. Someone suggested perhaps my receiver was off tuned. He was right. When I use my PRO 43 or my RS 2004 in scan mode and they stop on a given frequency (i.e. nnn.760) The RS 2006 will have to be tuned to nnn.765 to get really clean audio. The question is, can I do anything about this myself or does it need to be sent in for repairs. If so, who would you recommend..Grove? Any idea what the cost might be.

The other option would be to do all my searching in 5 mhz steps. Any comments greatly appreciated.

THANKS!

Terry

4459. NEED: PROGRAM CHART - ELECTRA BEARCAT BC-101

Newsgroup: rec.radio.scanner
Date: 1995-06-04 00:00:00 UTC
From: tatkins@unix1.sncc.lsu.edu
Message-ID: <3qt9sc$166h@unix1.sncc.lsu.edu>
Source record: 254718
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I need the programming chart or diagram for the old Bearcat BC-101 Scanner. This is the first programmable scanner Bearcat put out, and it is kinda of strange the way you have to program it. It has 16 dip switches (each ahs 3 positions) and normally they operate as "SCAN or DON'T SCAN" switches for all the 16 channels, but in the "Channel Program" mode they become DIP switches to program frequencies into each channel. The thing is, I have no instruction manual and no reference for the frequencies in terms of how to convert them into the binary on/off code for this scanner. Can anyone help? I have tried some ingenuity of my own in figuring out the sequences, but to no avail. And unfortunately from what I've heard, Electra (who use to put out Bearcats before Uniden took over) has long since closed. Any help would be much appreciated.

N> to figure out the other bands for other radios, ie:pro23,46 ect.
N> Any help wud be nice.....c u later Thanks

Ok, let's see if *I* get it right.
Take your first IF frequency (say, 10.7 MHz).
Double it (In this example, that would be 21.4 MHz).
Either add this (for up conversion) or subtract this (for down conversion) from the original frequency, and that's where the Image will be.
Say the original frequency is, 868.0 MHz. On a scanner using up-conversion with a 1st IF of 10.7 MHz, the image would be at (868.0 + 21.4 MHZ =) 889.4 MHz. Of course, if your scanner has the cell freqs blocked, that doesn't work. Soo...
Let's say your scanner has the cell band blocked up to 897 MHz. Using the above-configured scanner, images could be heard for frequencies down to (897 - 21.4 =) 875.6 MHz.
Does this make sense?

Thats the citywide output on the VHF band.You'll hear there also,from times to times,other enforcement agencies there as well,like FBI and DEA. As for the dispatcher talking a the same time as the units on the field,I've noticed that and can only speculate it might be some kind of a safe mode,where units can be heard even though the dispatcher is talking.However this is just a educated guess taken from about 4 years of listening to this system.Somebody else more technically inclined might have a diferent answer.

4470. Here is more info on Pro 2032 mod

Newsgroup: rec.radio.scanner
Date: 1995-06-05 00:00:00 UTC
From: jim.kenzig@cleham.nshore.org
Message-ID: <8AAB459.001F00147F.uuout@cleham.nshore.org>
Source record: 254579

The mod to expand the rf coverage is fairly simple. Under the RF shield behind the squelch - volume knobs (bottem of radio) there is a square chip. Diagonally below that you will see two little rectangular things (small) lying vertically and then three to the right lying horizontally, Immediately to the right of that is a chip diode which must be removed. below the chip diode is three "double dashes" which lie to the right of two more of the small rectangles. below that there are small four circles which lie to the right of more of those small rectangles. To the right of the circles is a series of verticle "stripes". three short, one medium and three long (Reading from left to right). A 1n914 diode (available at radio shack) must be connected between the top circle and the and the third small vertical stripe. It must be connected with the small band of the diode closest to the circle side. ------------------------------

Product...Realistic PRO-2032 by Radio Shack
Purpose...Modify for continuous 800 Mhz coverage
in appropriate 30 Khz steps where applicable

** Disclaimer...All modifications are done AT YOUR OWN RISK.
** Performing this modification may void your warranty.
** Perfroming this modification may enable certain portions of the 800 Mhz band that is illegal to monitor under federal U.S. law.
** I strongly suggest taking ESD precautions by getting a static strap as this involves work with static sensitive devices. Any electronics store should have one for purchase.

This information is from the June, 1994 issue of Monitoring Times, p. 112.

Required equipment...small-tip soldering iron, small gauge rosin core solder, desoldering wick, Phillips screwdriver, 1N914 or 1N4148 diode.
1. With the scanner unplugged from power, remove both upper and lower covers (foru screws in the rear of the cabinet), taking care not to damage the speaker wires.
2. Set the scanner upside down with the back facing you. Locate the microprocessor shield (upper left corner near vo#lume and squelch controls). Unsolder and remove the shield.
3. Refer to the diagram and locate the three-legged diode at the lower right of the microprocessor chip. Carefully unsosolder and remove this diode.
4. Referring to the diagram, place a 1N914 or 1N4148 switching diode across the solder pads as shown. (NOTE POLARITY) Remove any excess leads and carefully solder it in place. Be sure it's leads will not contact any other components, paths or the reassembled shield. A small piece of tape may be used as insulation if necessary.

5. Plug the scanner into power, turn it on and test the unit by entering
any frequency that may have been blocked in the 800 Mhz range.
6. If successful, unplug the unit and reassemble the scanner.

PA> a yippie proverb

PA> Paulo A Teixeira,N3MGA
PA> Sysop of Gallery's BBS at 202-333-0407.

the talkback is widely used with many public service systems that use
repeaters. the dispatcher often doesn't transmit from the base to the
repeater site on the same input frequency mobiles use to key the
repeater. instead, there are microwave control links or telephone line
control links to and from the repeater site that allow all signals the
repeater is receiving to be directed back to the dispatcher without
him/her having to unkey the mike. this is a fairly common system setup
and i've even heard it used by dispatchers to purposefully cover the
audio of the mobile unit transmitting so sensitive information isn't
spit back out over the air.

los angeles law enforcement has a slightly different approach to keeping
audio from being sent back out over the repeater. they have a cover
tone (short, soft beeps sent over the repeater output) whenever a mobile
unit keys up. all mobiles hear only the dispatcher speaking, which, in
my opinion, isn't such a bad idea, and cuts down the amount of radio
traffic the units have to monitor and mentally cut through to hear their

callsign. la maintains plenty of talkaround repeaters and simplex (tactical) channels should units need to coordinate directly with one another.

I have a Radio Shack 2026 for sale...in excellent condition, never used mobile with mounting bracket and instruction manual...I will also throw in a wall power supply that I modified for this scanner...if you don't know this is a 100 channel, 800 mhz. capable mobile scanner...thus you have to use a power supply with it...it has been modified to receive cell fone.

In the RS catalog it is $230.00...if you act now I will ship it to you UPS/COD for $180.00.

I also have a RS Pro-39...a handheld that has seen very little use...my son has it sitting on his desk and now wants to move onto something else...it has nicads with it and the charger-power supply...not sure if we still have the manual...it has not been modified for cell but can be done...

This is really in more than excellent condition...it is a double conversion receiver and works great...let's see in the RS catalog they make the equivalent Pro-51 and it sells for $300...how about $225 and I will ship the same way.

If interested e-mail here with a fone number and I will get in touch with you...I may have to leave town tomorrow and responses might be delayed, but have no fear, I will respond in the order I get any e-mail.

thanks...cleve

As a previous poster has noted in another message, not without a warrant it won't. I didn't follow ALL the details, but this (and not the restriction of our ability to buy cellular capable scanners) is the REAL significance of the ECPA.

AD> will hold up in court.

When dealing with this subject, as with many others, we need to be careful what we say. Andy just said that all the cellular phones out there are illegal to own, unless they are owned by law enforcement and government agencies.
What he probably meant to say is this:
It's illegal for anyone to monitor cell calls they are not a party to. It's illegal to import into, or manufacture in, the U.S. any scanners capable of tuning to cellular frequencies, except for the normal exceptions of those agencies which have a legitimate need for them, including commercial concerns that service cell phones and cell phone systems, and law and governmental agencies with such needs. Any law agency needing to listen to cell calls must get a warrant to do so.
And even this probably doesn't cover all contingincies.

Charge those batteries! The next scheduled disaster drill will be
on June 10, 1995 starting early (8AM). This drill will include
the southernmost counties of NJ, Cumberland, Cape May and Salem.
Medivac choppers will be used, Air Nat'l Guard, Fire, Police, Sheriff,
Rescue, Fire Police, CAP..you name it. Equipment and personnel with
victims will be transported. Stay tuned fellas!!

I have a set of Motorola Spirit VHF radios (SP-10??). These were originally blue dot units (unfortunately very busy around here).

These units have a four position DIP switch inside the battery compartment to change frequency (sixteen different combinations).

Does anyone have a table of frequency versus switch settings so that I can get them on the red or green dot frequency?

4486. Wanted: FCC Frequency List for IOWA

Newsgroup: rec.radio.scanner

From: pmccoy@netins.net
Message-ID: <009916AC.8BE464A1@netins.net>
Source record: 254645

I am currently in search of an official FCC frequency list for the whole state of Iowa, that lists in particular all Business and Special Industrial licensees that are licensed from low band all the way up to 800Mhz.

A large computer printout, or a disk that can be easily read and printed out on my computer (particularly a Windows program) would be great.

If you have anything like this, please contact me and we can discuss what exactly you have, and cost/shipping arrangements.

Thank you.

Paul McCoy

From: Joe Barry <joseph_barry@hpatc2.desk.hp.com>
Message-ID: <3qvko9$mm9@hpuerci.atl.hp.com>
Source record: 254651

Can anyone provide me with a recommendation for a used scanner in about the $200 price range?
I bought a RS Pro-46 about 1 1/2 months ago, and Although I am happy with the frequency ranges
it spans, I think I would like a hyperscan unit better. And wouldn't you know, the earpiece on my cell phone just went out, so I cant hear who I am talking to unless I have my scanner set
to the freq I am talking on. My pro-46 was not modifiable to do this, and that leaves me w/out
mobile communication. I'll shop for prices elsewhere, but I would appreciate a few recommendations
that may fall into that price range.

I believe the problem is actually that the search engine won't find freqs.
with more than 3 decimal places, i.e. 851.4125. Since most assignments
below 800 MHz are on even kHz steps, the problem doesn't show up there.

The problem is known and a correction is due momentarily (Chuck hasn't
said how it will be distributed, but he has been upfront about acknowledging
the error and working on it).

Whoa, there! Mobile data terminals (MDTs) are the answer to everything that's been mentioned--

1) They're not saving dispatcher costs by "drastically reducing personnel needed." Dispatchers are in the comm center, fielding telephone calls and dispatching on the radio. There are other clerical types that handle reports. And even then, someone has to verify names, addresses and sign off on the reports.

2) Most agencies have <not> converted to CAD. Virtually all cities over 100,000 have some type of dispatching automation, but everyone else just doesn't have the time, money or expertise to computerize. And even with MDTs, many cities (Las Vegas Metro included) are still using voice, because it keeps everyone informed of what's going on.

3) I agree, many agencies are computerizing records.

4) Yes, data is "more secure" than clear voice, but the increment is very slight. "Harder to decode" is more accurate than "secure."

Well, lets see if the Netcom server can stay up this time long enough for a reply. Heck. 3 crashes in 20 minutes.. sheesh! Sorry for the empty followups but the server seems to be expressing an attitude...

More than you probably wanted to know follows: :(

Joe McAesthete asked about the USGS Aftershock Alerting System:
[snip]
" They used radio for that, and I'd presume the new system also would so
" they wouldn't have to deal with network propagation delays. Anyone know
" anything about it? If it's a tone or a data burst on an otherwise quiet
" freq it'd be spiffy to pick it up.

The Earthquake Aftershock Alerting system was first deployed following the Loma Prieta earthquake in 1989. It consisted of four distinct components: 1) Seismometers and VHF telemetry transmitters placed within the epicentral area. 2) Receivers and the central processor at the USGS headquarters in Menlo Park. 3) A microwave link to the Monument Peak VHF repeater. 4) The alerting receivers that were deployed in the field (mainly for the protection of workers in and around the collapsed Cypress Street structure in Oakland).

The CPU algorithm eliminated triggers for seismic waves that originated outside the epicentral region. Some might argue that incoming wave from another earthquake would have been helpful but the primary focus of this experiment was to identify and alert teams about incoming waves from an already occurring aftershock with a magnitude greater than M3.7

The telemetry was sent to Menlo Park via low power FM (typically less than 250 milliwatts). The USGS telemetry was/is not encrypted and the signals are easily decoded and displayed on a PC screen with freeware from the internet (but that's another story...).

Once the central processor determined that the data met the criteria, an alert was transmitted. The repeater uplink was a microwave link to Monument Peak. The downlink was one of the VHF USGS freqs used routinely in the Bay Area. The specific freq isn't important because the transmitters and receivers are programmable for any of the USGS or Dept. of the Interior freqs. Furthermore, monitoring the channel wouldn't be of great help unless the receivers were capable of decoding the tones. Yep. Some of you have that ability...

The alert receivers carried multiple PL tones. Some tones were sent every 60 sec. to verify that the link was up and active. Earthquake alarms were triggered when the receivers were sent a different set of tones.

Obviously, it would be possible to monitor the freq and identify the tones but the USGS was not very forthcoming with the information for concern that someone might decide to hack away and send false triggers just for kicks... After all, the world *does* still have a few dweebs who take pleasure in that sort of thing.

There's a lot of potential to use a system like the one developed by the USGS. One scenario was for regular broadcast stations to maintain a link to the alert receivers so that an immediate alert could be broadcast. digital security would be needed to keep the dweebs from sending bogus trips.

(Aside)
Another offshoot of the aftershock warning system (bad pun unintended) has been deployed by a local Bay Area police dept. to triangulate gunshots. Microphones places about the community "monitor" activity. The sonic report get triangulated and the "good guys" respond - usually from data from the mobile data terminals...

SRI (Stanford Research Institute) got the good press for the application but the bulk of the research came from USGS work.

(back to the thread)
Rather than monitoring the alert tones it's more fun to actually decode the USGS telemetry and display realtime seismograms at home or work.
With the available software you can have your PC trigger for *any* large earthquake and be able to plot distance to source by moving pointers on the display.

The USGS Aftershock Alerting System is currently sitting in the basement of the Seismology building in Menlo Park waiting to be deployed. During its first six months after deployment it successfully alerted teams to 12 aftershocks with magnitudes greater than M3.7. It did not trigger on M3.6 or smaller events because they were below the programmed threshold. There was one false alarm due to a "bug" that was successfully corrected.

Unfortunately, not all large earthquakes in urban areas lend themselves to its use. Ideally, it works best when the center of activity is some distance away from the populated area. The greater the distance between the place of origin and the alert receivers the longer you have to get ready for the incoming waves. In the SF Bay Area typical warnings were only 20 - 27 secs. Not a lot of time unless you're one of the ones working on the rubble piles. The thrust fault under the LA basin is *not* a good candidate for such a system since the time between the arrival of the seismic waves and the alert signals are so small due to the short distances involved.

If you want to see if you can hear any of the many seismic telemetry transmitters use the search mode on your scanner and look between:
162.000 and 174.000
216.000 and 220.000
406.100 and 420.000

(Simplistic explanation...)
Many of the sites multiplex several signals on one carrier. Some only have one tone per RF carrier. Listen for a tone or set of tones. The seismic sensors output a voltage to a voltage-to-frequency convertor. As the voltage changes, so changes the frequency of the output signal. All you have to do is demodulate the signal, connect the output voltage from your demodulator to an analog-to-digital card in your PC, crank up your freeware software, and bingo... watch the lines squiggle across the screen.

It's a bit more complicated, and of course you need to be within line of sight of one of the low power transmitters. But, it's not *all* that difficult. There's a support group out there for seismo buffs. Most use their own sensors but a few monitor the telemetry. If your interested you might check out the PSN BBS system. There's 4 nodes around the country.
(901) 360-0302 Memphis Tenn.
(818) 797-0536 Pasadena, Calif.
(415) 327-1517 Menlo Park, Calif. (USGS has provided an 800 number for the SF Bay Area for this node)
(800) 328-1517 Toll free for users in the 9 Bay Area counties.
(408) 226-0675 San Jose, Calif.

4507. Uniden BC 2500 XLT for sale $270

Newsgroup: rec.radio.scanner
Date: 1995-06-05 00:00:00 UTC
From: fcwang@ATHENA.MIT.EDU
Message-ID: <3qvpq9$9a9@senator-bedfellow.MIT.EDU>
Source record: 254666
Cross-posted to: rec.radio.swap,ne.forsale,rec.radio.scanner

I'm selling a BearCat handheld scanner for $270. Model BC 2500 XLT.
It is new in appearance, and has only a few hours of use on it.
The cheap price reflects two things: 1) the channel/frequency selector
wheel is not working--you have to use the keypad to select your channels
and frequencies 2) no Uniden warantee.
I've been testing it out and everything else works just fine.

The history of the unit--I bought it new from someone local. It has
a warantee card in the box, but no receipt for the factory warantee.
It may have been a factory reject or something, because of the
selector dial. The only use it has seen is from my testing.

I would prefer to sell it to someone in the Boston area, so we can
deal in person. Otherwise, you would need to send me a postal
money order first, before I will send you the scanner. I do have
references on the NET as a legitimate buyer/seller of goods.

email fcwang@mit.edu if interested.

It comes with box/manual/antenna/AC adapter/Ni-Cd battery pack/case.

===

>in court.

Not exactly - on either count.

First, not just any "government" agency is allowed to own
cellular interception equipment. It's restricted to law
enforcement (by definition a government agency) and to
cellular service providers.

Second, if there was no warrant for the interception, the
conversation could be excluded from evidence at trial.

B> Can anyone tell me what a "fair" price is for the Pro2004 scanner?

A "fair" price is one that pleases both the buyer and the seller.
A representative price would be somewhere around $150-200, maybe more
depending on condition and area.

B> P.S.
B> Are there any further mods that I could make to this radio that would
B> make it more appealing to me?

Well, maybe if you could tell us what would make this radio more appealing
to you, we could tell you if there's a mod to do that. The question, as
asked, is merely an open invitation to list all mods that anybody knows
about, and even that wouldn't tell you *ALL* the mods that could be done.
The right way to ask that question is to first, determine what you want.
Then ask if anybody knows how to do that.

>thanks
>-chris

With a splitter, each radio will receive 1/2 the signal it normally would. Unless my thinking is wrong, that equals 3db of loss (3db is half power), so a small preamp would overcome that. Mast mounted preamps are best.
I doubt that the scanners will interfere with eachother, but it is possible. Some scanners put out a lot of noise, so they lock up other scanners on specific frequencies. The 2006 is pretty clean, but I don't know about the 8000. My 220XLT seems quite noisy.

From: smeier@uspto.gov
Message-ID: <3quptc$o33@pioneer.uspto.gov>
Source record: 254674

Well:

Consider this one. It's not hypothetical. I read in the Washington Post recently about a Loudon Co, Virginia (just ouside of D.C. about 40 miles) sheriff's deputy who 'accidentally heard' on a cellular frequency a rapist and the victim arguing on the phone.

As the story goes the deputy noticed a 13 yr old female walking along the road so the deputy picked her up and gave her a ride home. The deputy noticed the girl was upset but couldn't find out what was wrong. Upon leaving the residence she intercepted a "cellular" phone call between the 13 yr and a 19 yr old male who had just raped her not an hour before. Charges were brought against the 19 year old male and his accomplice who drove the car, a 17 year old (I think?) female. The case is still pending.

I read this in the post which stated it was a "cellular" interception and thought that maybe it was a cordless instead of
cellular phone interception that the deputy heard. The statistics of intercepting one of many cellulars is phenomenal and besides cellular is illegal. Not that law enforcement is beyond breaking the law, but this combined with the statistics, makes me believe it was probably a cordless phone interception.

Anyway, food for thought.

173.075 formerly was an FBI frequency, but the FCC reallocated the
frequency exclusively on a nationwide basis for those auto-theft locator
transmitters. To my knowledge, LOJACK is the only company making units
for that frequency. Others use systems in the 902-928 MHz band.

Hello!
I was wondering if anyone out there could help me out with my interference full BC-2500 scanner..(mainly paging tones). Most of you know interference can be very very annoying .. I have a BC-200 that when i plug it in to the same antenna as the BC-2500 uses, it gets half as much interference. The strange thing is the BC-2500 was much more money and I would at least expect better quality. I was hoping I could contact someone that has used a filter and maybe one of you could let me know how they work. Like I said the interference is mainly paging stations and quite bothersome noises. Let me know if any of you could help me out. Thanks!

I don't know about NASCAR , but, CART/IndyCar has a scanner booth that is a racket. The thing I didn;t like about it was the outrageous prices they charged. $289.00 for a BC200XLT. Geez. Another thing that pissed me off about IndyCar was that a freq chart was $35.00!!! Like the $50 for the ticket to watch it wasn't enough. I almost got booted when I let a guy copy the freqs from my scanner. I actually had security ready to throw me out. The only thing that saved me was that I made a scene and I was in the pit area and a few of the pit crews and drivers asked what the hell was going on. I mean, what the hell could they arrest me for??? Distributing public frequencies?? The dude at the booth claimed I had "stolen" the frequencies!! Ahhh. Well at least some dude from PPG realized what the hell was happening and apologized to me.

> frequency transmissions) for receipt and tuning by a standard FM radio?

You'll be lucky....

88-108 broadcast band radio is not only a different frequency, it's a
different modulation standard; wideband FM, rather than narrowband FM.
Although you'll probably hear *something*, the quality will be near useless.
As the deviation of your converted signal is so small, relative to what the
broadcast receiver expects, you'll get a very low output. The bandwidth of
the broadcast radio is so large that you might have problems with co-channel
interference (it lets two adjacent channels through, not just the one you
want). Finally, the tuning control of most domestic broadcast receivers is
pretty vague and wooly.

You would be much better off feeding your the output of your downconverter
into a better quality receiver, maybe a cheap scanner or airband receiver
that does FM. It needn't be expensive.

4538. Hint for 46 Mhz reception on hand held scanners.

Newsgroup: rec.radio.scanner
Date: 1995-06-06 00:00:00 UTC
From: <>
Message-ID: <3r0a35$51u@uc.msc.edu>
Source record: 254591

For those of you who enjoy listening to the 46-49 Mhz band I recommend the following setup. I live in a townhouse and an outside antenna is not possible. I used a BNC T adapter and two 5 foot sections of wire to make a cheap dipole antenna (468/freq in Mhz). Attatch one to the center and the other to the shield. Mine is no more complicated than a few pieces of electrical tape. The whole antenna just pops on top of your hand held unit.

The news that a better antenna increases range is not new to anyone here. The news is that with my Pro 43 I could hear activity over 3 blocks (long ones) away when the stock antenna could barely pick up activity across the street. Better yet, the setup is portable, cheap, and expendable and you probably have all the parts in your junk box.

Happy scanning!
NeillJ

4539. Wanted: FCC Freq List for IOWA

Newsgroup: rec.radio.scanner
Date: 1995-06-06 00:00:00 UTC
From: pmccoy@netins.net
Message-ID: <0099170E.C9097067@netins.net>
Source record: 254592

I am currently in search of an official FCC frequency list for
the whole State of Iowa that lists in particular all Business and
Special Industrial licensees from low-band all the way up to
800 MHZ frequencies.

A large computer printout, or a disk that can be easily read and
printed out on my computer (particularly Windows program) would
be excellent.

If you have anything like this please contact me and we can discuss
what exactly you have, and costs/shipping.

Thanks.

4545. UNRAVELLING THE PRO-46 MOD

Newsgroup: rec.radio.scanner
Date: 1995-06-06 00:00:00 UTC
From: an187330@anon.penet.fi
Message-ID: <035303Z06061995@anon.penet.fi>
Source record: 254598

I bought the pro46 on Dec 30/93
the serial no. is 35003188
followed by 6A3 underneath

On the inside backcover it is written MI-25740G1-HP UB 222

Is the unit modifiable ?

I was following a mod taken from May 1993 Monitoring Times

I desoldered 2 of the 4 corners of the shield covering the
Uniden 1489 microprocessor and I saw a BLUE chip jumper to the left of the
microprocessor, labelled
600J and underneath
an encircled M followed by a D (or O?)

I cut out one of the leads of that jumper but after reassembly
I had no power at all (blank display and mute speaker)
So after resoldering the cut lead the gadget works fine as before

(I used a 15 watt soldering iron)

There is also a device labelled C B
2 Y

to the right of the uP but i do not think it is a a chip jumper because
it has 3 leads (it is black coloured)

I would greatly appreciate an explanation of the circuit in the mod
because it is totally unclear to me after pondering over it for a few
weeks: The first thing that matters is to locate those 2 jumpers. Also

what it that IC in the diagram ?

Yours truly
Nosy

>462.9-463.3 range and the 467.9-468.3 range. I believe med-5 is 463.10
>
>JOHN
>
You're in the ballpark. Med freqs use pairs, *usually* the base/repeater using
the lower one and the mobile using the higher one. They are:

med1 463.000 / 468.000
med2 463.025 / 468.025
med3 463.050 / 468.050
med4 463.075 / 468.075
med5 463.100 / 468.100
med6 463.125 / 468.125
med7 463.150 / 468.150
med8 463.175 / 468.175

Sherwin Lee (slee@netcom.com) wrote:
: does anyone know the easiest way to mount a pro 43 into a car? I have a
: 1991 Toyota celica ST. Any replies would be appreciated. Thanks.

I used velcro on the bottom of my 43 to mount it to the center 'console' in my wife's '91 Festiva. Power is supplied by a 12V-9V converter semipermanently wired into the cigarette lighter wiring (along with a noise filter). I put an antenna splitter behind the radio and ran a length of coax with a BNC plug up to the console (believe it or not, this works all right). I used to have the sound fed through a CD adapter in the tape deck, but I switched to the Rat Shack clip-on speaker clipped onto the shoulder belt.

Quick to attach and remove, works all right (although I can't see the display very easily - and reprogramming it while driving is a virtual impossibility, although I'm teaching my wife to do this), and best of all, I didn't have to drill any holes or cut any wiring.

I've owned both. I like the BC3000XLT better. The 550-760 gap is
UHF TV. According to someone on CompuServe who spoke to Uniden,
the UHF TV support in the Pro-26 is why it only has 200 channels
instead of 400. What a deal... :-(

The BC3000XLT is worth having over the Pro-26 just for the extra
200 channels alone.

If you have access to the CompuServe HAMNET libs, there are a couple
of BC3000XLT vs. Pro-26 comparison files. If you have any specific
questions, you can e-mail me directly.

I'm looking to buy a used, but in good shape, portable scanner. I've looked around town and seen the Pro-39 for $220 and the Uniden SC150 for $175, both new.....I'm looking to pay around 70% of the price of a new scanner.

Any AR-8000 Guru out there???

Question's

#1--What/which, is the best Comouter Interface???

#2--What/which, is the best software???

#3--Please upload any files for the AR-8000. How to issue commands
from the computer to the scanner, so as to load frequency's
into memory..
Thank you all,

You're forgetting the recently passed H.R. 666 which in short removes the technicality issues such as the above. It's worded to give law enforcement previously unheralded powers to prosecute.

Bearcat BC-2500XLT Hand held scanner. $275 shipping included.
400 channels in 20 banks. Has wall charger, rubber duckie antenna,
One Battery pack and one additional plastic package that could be
rebuilt with new Ni-Cad batteries. Also have the operators booklet.
Banks 1 through 10 have Priority capability on first channel of each bank.
Turbo Scan allows scanning of up to 100 channels per second.

Frequencies covered:
25 - 26 Mhz (NFM),
26 - 29 Mhz (AM),
29 - 54 Mhz (NFM),
54 - 72 Mhz (WFM),
72 - 76 Mhz (NFM),
76 - 108 Mhz (WFM),
108 - 137 Mhz (AM),
137 - 174 Mhz (NFM),
174 - 216 Mhz (WFM),
216 - 225 Mhz (NFM),
225 - 400 Mhz (AM),
400 - 512 Mhz (NFM),
512 - 550 Mhz (WFM),
760 - 1300 Mhz (NFM) Cell Phone frequencies restored.

Hello all,

I am considering purchasing the Ramsey SS-70 Speech Descrambler. I want to be able to descramble cordless phones, police and scramble my calls... Has anybody had any experience with this unit? Does it work very well? If I get it I plan on getting the kit. Is it hard to put together? So if anybody knows how well this descrambler works PLEASE let me know.

It would be best if you could e-mail me directly (jthompso@nermal.santarosa.edu) or if you can't e-mail post here then.

Thanks,

John Thompson

At NASCAR races there is usually a scanner booth where they
sell scanners (like Bearcat handhelds) that have been modified
to have extra loud audio output. Not too healthy for your hearing
but should help. I agree with Jamie that good headphones would
be very important.

Jamie Hanrahan, Kernel Mode Systems (jeh@cmkrnl.com) wrote:

I wrote commercial windows software for the R7100 some time ago.
The two radios are different in two ways.

1. It is not possible to read the s-meter back from the R7000 (a
bit limiting)

2. There is an address field used in each RS-232 instruction. The
two radios have different addresses so you will need to change it
before the software will work.

Other thnan the two points above, there should be no problems using
software for the R7000 with an R7100.

4573. Screwed BC200XLT Mod

Newsgroup: rec.radio.scanner
Date: 1995-06-06 00:00:00 UTC
From: critchie@ix.netcom.com
Message-ID: <3r2iqf$p37@ixnews2.ix.netcom.com>
Source record: 254626

Was wondering if anyone has followed the general mod for restoring Cell to the Uniden BC200XLT? Tried following the established mod from a mod server but think I clipped the wrong resistor. The mod says to clip the resistor above 'DEN' on the word 'UNIDEN' located on the processor, but when I looked there were two positioned above the 'DEN' one to the left and one to the right. The one on the right was black the one on the left was brown. Since the one on the right (next to a screw) was positioned more over the word 'DEN', I decided to clip it. When I reassembled the radio, nothing. The entire radio died.

Now, I've returned the radio and am ready to try again. I figured I'd ask someone who has completed this operation succesfully for any tips before continuing.

Any help will be greatly appreciated.

4577. Another cheap antenna

Newsgroup: rec.radio.scanner
Date: 1995-06-07 00:00:00 UTC
From: bbraun@assi.s-link.de
Message-ID: <5nQGWtPHnXB@p-bbraun.assi.s-link.de>
Source record: 254480

Hello,

here is the description of another cheap scanner antenna: All you need is a few meters of common coax cable (RG58) and a BNC jack. First you have to calculate the required length for the frequency range you mainly use:

Length (m)=75/f(MHz)*0.85

Now remove at the end of the coax cable the calculated length of the outer insulation. You should see the shield around the inner wire. Strip the shield over the remaining insulation by pressing it together to make it wider. This step may be a little bit tricky. The cable now looks like this:

```
IIIIIIIIIIIIIIIIOOOOOOOOOOOOOOOOoooooooooooooooo
insulated coax shield over unshielded inner wire
insulation
```

Lastly, mount the BNC plug to the other end of the coax and your antenna is ready for use. I have soldered a little ring at the end of the inner wire to hang up the antenna at a nail or something else. The antenna should be located straight vertically.
I have designed my one for the 4m band, but it works also fine on the 2m ham band and on 70cm.
Instead of stripping the shield over the coax you may instead use a copper pipe of the desired length which must be stripped over the coax. Solder the shield to the pipe.

Ciao...Bert

Does anyone know of a way to use a scanner (Pro-43) as a weather radio? I live in Southern Wyoming and we have had numerous weather warnings (from storm watches to tornado warnings). I thought gee, how would I know about these at night? I don't really want to rotate sleeping shifts with my wife so we can just listen to the NOAA loop tapes in case they issue a warning. So any ideas for this scanner that might let it function as a weather alert radio. I know I could buy one but that's not much of a challenge.

Happy scanning to all...

: freqs. active if one does not live near an air base?

Well, it all depends. I used to live at least an hour from an air force base, and every other weekend a training squadron would do their drills right above my house, and any communication you would hear on the 108-136 range would be them contacting a civil airport for landing clearance. Everything else was in the 200-300 Military Aircraft band. In addition, NORAD signaling frequencies and now with the new restructure of the U.S. Strategic Command, they will be using alert frequencies in the 200-300 MHz band. What I'm getting at is if you are interested in those types of communication, I'd say go with it. That's about all you will hear in that frequency range.

Very simple. Construct a PL squelch/decoder unit for whatever the PL
tone is that the NWS sends out for EBS bulletins. I think it's right
around 1000 Hz or so. You could construct it to plug into to the
earphone jack of your scanner, insert the PL squelch/decoder unit, then
add on another speaker...all in a series, and that would only activate
the speaker when the tone is transmitted. When you want normal operation
again, just unplug your home-made toy. You wanted challenging, and I
give you that. :) Figuring out how to do it is your job.

Regarding the Opto computer interfaces for scanners... Yes, both the
Opto OS456 (for the Pro-2005 and Pro-2006) and also the new Opto OS535
(for the Pro-2035) that we provide can decode CTCSS (52 tones), DCS
(106 codes), and DTMF (16 digits/characters).

All the best!

: your own??

For your own personal use, nope. However, most scanners now days use multilayer PC boards and small components using surface mount technology. Some of the tuned circuits are also critical in component placement, etc.

However, some of the "older" scanners (non synthesized, 1970's vintage) have nice clean layouts that may be doable....

Have fun!

This is probably a water level gage. In the old days, the data was
recorded on a punched tape, and someone had to visit these sites every so
often to collect the data. I believe the data now is transmitted up to
the GOES satellite, where it is relayed to the USGS. You often see a
small concrete building on or near a bridge with the yagi pointed
skyward.

1**********
**
I have a PRO-51 with a date code of 7A4. This seems to be the LAST
date coded model that can take the keyboard mod as I have tried it on
later models with NO success.

Try this: (1) First try hold LOCK-OUT, 2 and 9 keys down while turning on
power. Test frequencies should be loaded into the first 25 channels (maybe) .
If channel 23 contains a magic frequency then you can direct search .
****
******
(2) IF that does NOT work (THIS WILL !!!!!) hold down BAND, 2 and 9 down
while
turning ON power. Now, in the digit test mode, all digits of the LCD will
move slowly from the left
to the right of the display.

(3) When the movement advances nearly to the right end of the display, press
and hold the
LOCK-OUT, 2 and 9 keys until the digit test mode stops...
The display will blink, NOW the radio will begin scanning the factory-preset
frequencies.
Manually step to channel 23, which will display 888.960 MHz, roughly
the middle of the
cellular band. Start a normal, direct search routine from this frequency to
cover the cellular freq's.

(NOTE) This will wipe out all stored frequencies. You will want to keep CH #
23 open , so you can
do your searches up or down from 888.960. Once you search higher than 896.000
, or lower than
869.000 , you will need to manually step to CH # 23 again. (once you search
past those ranges
you need to go back to the middle by going to ch. 23)

After you get the mod complete it is safe to program the scanner back to
wherever you had it, just
keep ch. 23 open for cell.

Hope this was not too confusing. HAPPY SCANNING!! |-))))))))))

I had good luck listening on 141.85, so that seems like a good shot.
It's fun to hear them say "smoke on", "smoke off", or "roll!" and then
seeing the planes do exactly what they said. The pilots sound very
professional and cool during all this and I never heard an "oh sh*t!".

I strongly suggest using a good set of earphones because the plane and
crowd noise can be overpowering and some of your neighbors may not
want to hear your radio.

I would like to get a radio with HF and sideband to receive Military. I now have a BC3000 and a Radio Shack DX-380. The 380 doesn't have sideband. Are some of the smaller portables ,like the 380 only with sideband, anygood for this or should I save my money for a better desktop unit like an Icom. I would like to save some money but I have gotten to the point that better now means more to me than cheaper. As long as it doesn't cost TOO much more.

I bought the pro46 on Dec 30/93
the serial no. is 35003188
followed by 6A3 underneath

On the inside backcover it is written MI-25740G1-HP UB 222

Is the unit modifiable ?

I was following a mod taken from May 1993 Monitoring Times

I desoldered 2 of the 4 corners of the shield covering the
Uniden 1489 microprocessor and I saw a BLUE chip jumper to the left of the
microprocessor, labelled
600J and underneath
an encircled M followed by a D (or O?)

I cut out one of the leads of that jumper but after reassembly
I had no power at all (blank display and mute speaker)
So after resoldering the cut lead the gadget works fine as before

(I used a 15 watt soldering iron)

There is also a device labelled C B
2 Y

to the right of the uP but i do not think it is a a chip jumper because
it has 3 leads (it is black coloured)

I would greatly appreciate an explanation of the circuit in the mod
because it is totally unclear to me after pondering over it for a few
weeks: The first thing that matters is to locate those 2 jumpers. Also

what it that IC in the diagram ?

Yours truly
Nosy

>4) Yes, data is "more secure" than clear voice, but the increment is very
>slight. "Harder to decode" is more accurate than "secure."
>Gary Allen

1. Actually, in large dispatch centers for non MDT-equipped agencies, approximately one in three dispatchers is employed to handle queries (vehicle registration checks, DL/wanted checks, etc). An MDT-equipped fleet can almost entirely eliminate the need for this position, except for specialized (e.g. warrant verifications or data entry) functions (which can usually handled by other dispatch personnel).

This can mean a 33% reduction in staffing loads; most people would consider that a substantial reduction in staffing (and the tax dollars it takes to pay for it). While I've never heard of a dispatcher losing a job over MDTs, the technology frequently delays the need for additional positions.

Many agencies now require officers to enter their reports directly into the department's computerized reporting system as opposed to dictating their reports or submitting handwritten report. This also results in the elimination of a good chunk of the clerical staff, which generally isn't part of the dispatch or communications division anyway.

2. CAD packages which run on as little as a single Windows-equipped PC are available for less than a thousand dollars. In the midwest, I know of numerous agencies serving populations of 5000 or less which have been CAD-equipped for years. Of course, you can spend hundreds of thousands of CAD packages which run on substantially more sophisticated platforms.

4. While mobile data is generally not encrypted, its inherent use of patented, proprietary protocols (these are NOT the protocols you're probably familar with such as those employed in wireline modems) means that 99% of scanner hobbyists will be unable to decode the information or unwilling to spend the time/money/effort to try to crack the system. Additionally, large (in either capacity or geographic service area) MDT systems transmit simultaneously to multiple squads ON A SINGLE CHANNEL by employing multiple, non-simulcast transmit sites. This means that, unless a scanner is located fairly close to the "target" squad, it will probably be receiving conflicting data from more than one transmitter simultaneously. And there's not much anyone can do about that. All of which sounds "more secure" than clear voice communications to me...

>#1--What/which, is the best Comouter Interface???

There are currently three alternative computer interfaces for the AR8000...

Manufacturer	Model	Approx price	Approx size	Advantage over other alternatives
1. AOR	CU8232	$125	12x7x3 cm	Allows AR8000 cloning
2. EDCO	AR8000INF	$100	6x5x2 cm	Small size (DB25 hood)
3. Optoelectronics	CX12AR	$ 88	10x5x3 cm	Also use with Scout 40

Sizes and prices are all from memory, so take them with a "grain of salt".

All the best!

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483. Uniden currently charges |
a flat rate of $54 for scanner repairs. They will repair |
and return "out of warranty" items without an estimate |
unless the repair charges exceed the flat rate charges. |
The phone number for repair is (800)297-1023.

G & G Communications (telephone (716)768-8151) is a family |
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands. They are located at 9247 Glenwood Drive,
LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to

drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd

electrolytic capacitor in series between the external
speaker jack and audio amplifier.

I've been waiting over a year for this to happen, and finally it looks like a reality. I've been corresponding with a gentleman from Chicago who has a Macintosh interface to the Optoelectronics OS456 for the Radio Shack Pro-2006. It's called WAVE, and a demo should soon be available on America Online. Anyone interested should contact Mike at mikeasl@aol.com. I have no connection with Mike outside of the correspondence we've had. If you'd like, I can forward anyone copies of his descriptions of his software. It will reportedly support all of the features of version 1.2 of the card, and follows all Apple guidelines.

Happy Scanning,

```

Just returned from a vacation in the Ft. Walton Beach, Destin, Florida area. I discovered a couple of freqs. that could be of minor interest to someone else headed that way.

The Ramada Hotel in Ft. Walton on U.S. 98 uses 154.600 for all their communications. You'll hear a lot of "Rm. 2048 needs clean towels", but every once in a while something interesting comes up. I happened to be there the night Sen. Phil Graham was due to check in, so the staff was busy preparing to try to make a good impression.

The water slide across the street uses 154.570. Finally, I found local law enforcement activity on 460.075 and 460.475.

>police and not Capitol Police. They also seem to respond to calls all
>over the city.

159.15 -- known as "Citywide" and a simulcast version of 460.325 -- is where any D.C. police unit not tied to a specific area of the city will be found on their radio system.

In the D.C. radio system, each police district has its own frequency. Such units as traffic control, CID, police tow trucks, units in subway tunnels, etc., operate throughout the city, not just a particular district; these are the ones to be found on 460.325 [input is 465.325] or simulcast on 159.15 [input is 155.25]. Pursuits are often found on "citywide", as are detectives, homicide, etc. Often a unit with only a 155MHz radio in the patrol car will use citywide's cross-band simulcast on 460.325 to contact another unit with only 460MHz capability. One exception to the "each district has its own 460MHz frequency" is that the First District [including South-West Washington and Capitol Hill -- I think the northern border is K Street Northwest] is often also found on "Citywide" to reduce the need for another dispatcher.

Good listening!

Joe

From: wtmj@aol.com
Message-ID: <3r65u8$ab4@newsbf02.news.aol.com>
Source record: 254438

Mequon and almost all Ozaukee Public Service agencies are on the 800 Mhz trunked system:
856.7125
856.7625

857.7125
857.7625

858.7125
858.7625

859.7125
859.7625

860.7125
860.7625

Put them all in a seperate bank... Lock out which ever one has the control channel up all the time (858.7125 today).. and scan the rest... to follow a conversation of interest you have to keep hitting scan... It's not too hard, you get the feel of it after awhile..
Fire Departments still page on 154.16..

Whoops! Messed up last post. Ok, I need feedback from owners of Pro 26 scanners. I just put one on layaway at Rat Shack. I just wanna know about the clearity, range, options and features, and whether or not the scanner is worth ALL THAT MONEY!!! Thanks.

4630. FREEWARE R7000 Windows Software

Newsgroup: rec.radio.scanner
Date: 1995-06-08 00:00:00 UTC
From: forsberg@cts.com
Message-ID: <D9uAy3.I9q@crash.cts.com>
Source record: 254441

I sent the below message a week ago but it had the incorrect ftp address. Below is the corrected message

I have written a Computer Assisted Scanner program for the ICOM R7000 radio. It requires Windows 3.1. It will control the R7000 radio via an RS-232 interface. It is available on the internet via FTP at oak.oakland.edu in directory /pub/hamradio/pc/ham-utils as r7000c13.zip. If you do not have ftp access via the internet then you can receive it from me for $1 in USA or Canada and I will supply disk, mailer, and postage. Please specify disk size.

From: forsberg@cts.com
Message-ID: <D9uAyB.IAs@crash.cts.com>
Source record: 254442

I sent the below message a week ago but it had the incorrect ftp address. Below is the corrected message

I have written a Windows 3.1 program that will decode the Telemetry from the DOVE amateur radio satellite. The DOVE satellite transmits on a frequency of 145.825. Since it only makes about 2 passes a day and each pass is about 10 minutes, you will need a satellite tracker to determine when it is present. My program will with a Packet TNC decode the telemetry data. It is available on the internet via FTP at oak.oakland.edu in directory /pub/hamradio/pc/satellite as dovedv12.zip. If you do not have ftp access via the internet then you can receive it from me for $1 in USA or Canada and I will supply disk, mailer, and postage. Please specify disk size.

Message-ID: <9506091304467797@chemek.com>
Source record: 254443

Just for information, Salem Oregon Fire Department is testing operation on 857.7125 as a fireground frequency. They used it for approximately half an hour at a fire in West Salem. They ultimately gave up and went back to F-1 on VHF because the UHF was not working well.

However, nothing in radio or TV works well in West Salem. One thing I will note is that they were copyable in East Salem on UHF probably because they were repeatered. They were not copyable once they went back to VHF, which is all simplex. (Win some, lose some).

>>>From: bobszabo@ix.netcom.com (Bob)

>>>I have not seen this frequency listed for DC but I can hear DC
police
>>>on it. Does anyone know what this frequency is? I'm sure it is DC
>>>police and not Capitol Police. They also seem to respond to calls
all
>>>over the city.

>>>Bob Szabo

This is the VHF simulcast of the Citywide 1 channel (460.325)
for DC police. I think it also operates as a seperate
repeater
for field units that operate on a seperate VHF system for
surveilance.
Any more questions?

>> |is it illegal to use a schematic of a manufacturer of a scanner to build
>> |your own??
>
> It would depend on whether any of the circuitry is patented; yes, believe
> it or not the use of a patent even for personal use is illegal without
> permission...

Your statement on legality is incorrect. Personal use is not actionable.
In fact patent infringement is almost always a civil matter and then only
when you make use of patented technology for commercial purposes. So
believe it not. But don't trust me consult a patent attorney. The worst
legal advice you can get is light years better than the opinions you
find here.

By the way it is no sweat to bring an unblocked scanner into the country.
What the modification to the ECPA prohibits is manufacturing (commercially)
or import for resale. Non type accepted receiving equipment has always
been permitted in single quantities for personal use of the importer.
I suspect a lot of the rumors about illegality stem from the desire to
promote panic buying and the resultant inflated prices.

These are my opinions and worth exactly what you paid for them.

I just recently heard and recorded and conversation dealing with organized crime
A very detailed conversation.

I met with Vice and gave them a copy of the tape.

I do not nomally record and this is the first time I am involved with the police.

Did I miss something? Is it now illeagal to listen to the regular old-style cordless phone freq's .....it used to be legal and the evidence has been used in court.

Am I subject to prosecution for this act?
Serious responses would be apreciated thank you

Message-ID: <3r6rlh$gct@whitbeck.ncl.ac.uk>
Source record: 254493

Hi all. Over this summer, I am going to write a real time ACARS
decoder which will be capable of fully decoding ACARS messages using the
Lowe Airmaster decoder. If anyone else uses ACARS, has any ideas, or is
interested in helping in some way, please contact me.
I've only just got my decoder, which is excellent (apart from only
supporting a 25 way serial port :-((but I spent yesterday making a cable
to use it with 9 way) and would appreciate talking to anyone who knows
exactly how it works - I haven't had the time to work it out yet!
The program would probably be written in Pascal, or perhaps ADA,
but we will see....

Thanks in advance, Pete.

> freqs. active if one does not live near an air base?

There is more activity in that range than most people are aware. I recommend supplement the scanner with a good mil-comm directory (Grove sells a few). A good antenna is a must also. Finally, don't overlook the 30-50Mhz range (30-30.56, 32-33, 34-35, 36-37, 38-39, and 40-42 Mhz). There are a very large amount of mil comms there, both ground and aircraft, including helo's.

I get 2 hours of remote taping over a 24 hour period scanning the UHF and low VHF freqs mentioned above. You will need the directory and be ready punch in 200-300 channels!

Andy

Where did I say only law enf. agencies can own cell phones?

The past few months of congressional legislation have given law enforcement
the power to bypass the legal loophole previously enjoyed by criminals.
It also opens up misuse issues by the govt but that topic is for another
newsgroup. Gopher to the congressional gopher and pull up HR 666 for yourself,
as I did months ago.

Please don't misquote me...

Try giving this company a call.

Racing Electronics
1800-272-7111

I bought a bearcat 200xlt from them and they
have a racing package that comes with headphones
and the driver frequency listings for all
motorsports. I used mine at MIS for the
Marlboro 500 Indy race and I was quite pleased
with the sound. It was plenty loud enough to
hear over the engine and fan noise.

Joe,
147.060 is in the 2mtr. ham band. NOAA doesn't transmit there, so you must be getting a ham that shouldn't be digital/simplex at 147.060.
Ask around the amateur community for info on the "how to" and the "how come?"

Butch, KF5DE

That should have read as 25-550 mHz.

And yes, an excellent receiver. Very sensitive yet selective. Its only
less than stellar performance is in scanning speed.

I> Did I miss something? Is it now illeagal to listen to the regular
I> old-style cordless phone freq's ....it used to be legal and the
I> evidence has been used in court.

It's now illegal. The ECPA has been changed to remove the exemption that
cordless phones used to have.

I> Am I subject to prosecution for this act?

I'm responding to you personally.
I'm not a lawyer, and this can't be taken as legal advice, only as my
opinion.
Yes, you are probably open to prosecution. Will you be prosecuted? Probably
not. However, what you did was illegal, and you provided proof of your
illegal act to law enforcement officers.
Relax, the chances of you actually being prosecuted are probably somewhere
between slim and none.
What the Vice people do with your tape is up to them. They can't use it as
part of eiother an investigation or prosecution, as it's tainted evidence.
However, if they somehow get the idea to watch the people or place involved,
and observe for themselves an illegal act, they may be able to shine on
where they got the idea from. Maybe.
My personal opinion advice: never do that again. Let the government figure
out for themselves how they are screwing themselves (of course, that's a
whole 'nuther story. Has to do with the fact that the gummint really doesn't
want to win the war on drugs. Ask me if you want my opinion on this.).
Hope this helps.

M> how they work. Like I said the interference is mainly paging stations
M> and quite bothersome noises. Let me know if any of you could help me
M> out. Thanks!

Filters are expensive, and probably not much good for your problem, anyway.
Believe it or not, the answer may well be a worse antenna!
Usually, in an area where pagers are a problem, there are a lot of other
utilities as well. These other utes are probably pretty well receivable
without a terriffic antenna.
So, you already got an antenna. What to do?
Do what I did. Go to Radio Shack, pick up a TV attenuator. Can't find my RS
catalog, or I'd give you the cat #. It's an Archer TV & VCR OERLOAD
ATTENUATOR. It's variable, so you can adjust it to your needs. Works for me,
& I'm in Pager Alley here in Phoenix. I use it on a PRO-2022, and it cuts
pager interference quite a bit.
You might try an OCF (Off-Center-Fed) dipole antenna, and see if that
doesn't cut the interference.
Hope this helps.

Try Radio Shack. Use one of their in-line amps to increase the reception.
Remember, if the scanner has a wide front-end, you might have intermod
problems.

In the UK, "Polco" brand do a really nicely made cellphone holder that works well with handheld scanners (I have two screwed to the dash, one for each !) It has a nice clamp action, with a wide foam-padded arm on each side, linked by a geared mechanism like the envelope feeder guides on some laser printers. A ratchet holds the clamps tight, and a little button pops them loose. Mine cost 10 UK pounds retail, and I know Nevada stock them for mail order. It's half the price of the "Ora" cellphone bracket I had in the last car, and much more solid.

}
}
Oh here you go man.......
I bought mine about 3-4 weeks ago. Like it alot, but...

Try to avoid rechargeable batteries. The sucker eats them. Gotta drain and recharge every night it seems. I think because the thing is plugged into my head most of the time.

The speaker seams a little weak for its ability to overcome normal car noise. This may be because of the rechargeable batteries that I am starting to dislike. I use an earjack or one of those small external speakers through the external jack.

If your going to run it off the cigarette lighter, get a damn good power supply for it. Engine noise will make you throw it out the window. I would also recommend getting the AC adapter for it. Makes home listening easier while it charges the batteries.

Functions are good. I like the continuous coverage, however I thought at one time I found a skip somewhere but have not been able to relocate it. May have been operator error.

Has good sensitivity with the factory rubber duck entenea.

No factory problems found to date other than the battery cover flys off if you get to rough with it.

4683. Re: Filter

Newsgroup: rec.radio.scanner
Date: 1995-06-09 00:00:00 UTC
From: cntrmeasur@aol.com
Message-ID: <3rapgh$87f@newsbf02.news.aol.com>
Source record: 254384
Cross-posted to: rec.radio.scanner,alt.radio.scanner

As a result, I am getting large
amounts of white noise and other kinds of interference.

Remember; NYC has GOBS of RF floating around. Since you've added a higher gain antenna than the rubber duck that came with it (or whatever it was), you are going to gain reception on virtually ALL frequencies. I don't think you need a filter. I think you need to either attenuate your antenna (by pushing the attenuator button if you have one or by putting one in line with the antenna feed line) or use your stock antenna.

Do you actually get better reception on any frequencies with your dipole? do you actually need it in the city? these are questions you'll have to ask yourself. Remember; if you attenuate your signal from the dipole, you're kind of defeating its purpose.

hope this helps

well, if is overpriced, is a problem that you have to deal with Icom, I already sold 9 units and everybody is very happy with it, they said, that an Icom IC R1 BLOCKED, are priced at $419.95 as an special limited-time offer, and like a said this unites are blocked and the ones I'm offering ARE NOT. You can check in Popular Communications of July 1995, page 21.

On June 7, 1995 at approximately 11:45 AM MST (1845 UTC) I monitored an unidentified fire department on 46.12 MHz from my listening post in Phoenix, AZ. I had been receiving several other agencies (which I was able to identify) on low-band VHF from Missouri, Kansas, and Nebrasks. I am assuming that the fire department transmissions I heard originated from the same general area, but I was not able to hear anything which would enable me to identify what I was hearing.

The traffic I was hearing involved "Engine 3", "Car 3", "Command" and "Engine 5". If anyone monitored similar traffic on 46.12 MHz at the given time, please let me know. I know sporadic-E propagation is nothing out of the ordinary during this time of the year. I just want to identify this transmision for my logs.

Please respond via e-mail, as my news server loses about 30% of incoming posts.

The next official meeting of the Chicago Area Radio Monitoring Association will be held Saturdaty, June 17 at the Napervile Emergency Operations Center, 1380 Aurora Ave in the Police/Fire building. The meeting formally begins at 1:00 pm. You may arrive early for informal chit-chat before the meeting. Lunch will not be available, so try one of Naperville's many fine restaurants before the meeting.

To get to Naperville EMA from I-88 tollway and Route 59, go south on Rte 59 to New York Street, by the Fox Valley Shopping Center. Turn Left (east) on New York (which will turn into Aurora Ave.) to the 3rd light (Birchwood Ave.). This is the Police/Fire facility. Go to the Fire Station on the right, use the last entry door and follow the signs to the meeting room.

Amatuer Radio Operators may use 145.7700 Simplex (151.4 PL) for 'talk-in' frequency.

Anyone wanting more information about CARMA can write to...

CARMA
PO Box 2681
Glenview, IL
60025

or visit the CARMA BBS at 708-852-1292. CARMA requires 8-N-1 format and has access speeds up to 14.4k baud.

Hope to see you there June 17.

Mi> Does anybody know of ant MOD's for the PRO-2030 from Radio Shack of
Mi> any other similat scanners?

Sure...if the unit was manufactured before April of 1994 (below 4A4 datecode). Pop open the case. Look for L201. If L201 is present, cut the part in half and seperate the wires. If it is not there, then forget it.

Cutting the part restores full 800 Mhz coverage in 30 khz steps when required. (Performing the above is at your own risk. The mod does restore portions of the 800 Mhz band that is against US federal law to monitor.)

Good luck...Jerry

Kb> Looking for info on the PRO-2006 scanner. I don't need the 800MHz
Kb> mod, but am looking for the key sequence for changing to 30KHz steps,
Kb> and any other hidden features that this radio has.

Piece of cake...while searching the band that requires 30 khz stepping, press the RESET key on the front panel. (not to be confused with the RESTART key at the back of the radio.) There is only one area in the 800 Mhz region that uses the 30 khz steps.

There are no other hidden features that I know about for this unit.

Source record: 254396

-=> Quoting Catalano@usis.com to All <=-

Ca> Hiya.. I was wondeirng if someone could explain to me what cellular
Ca> images are? THanks

Images are a 'mirror' of the actual frequency. It is a by-product of receiver design that can be either a 'feature' or a bad design. And it is not just for cellular either...it's for any frequency that can be programmed into a scanner.

On my Bearcat 210 XL, I receive the local PD on 471.1375. The image of that is (2*IF)+471.1375, where IF is the intermediate frequency of the scanner. On the 210 XL, the IF is 10.6 Mhz.

On my 2500, images of cellular phones typically found in the 870 to 890 Mhz band can be received in the 1270 to 1290 Mhz band. In this case, the IF of the 2500 (one of them anyway) is 200 Mhz. (2*200)+870=1270. This is the image of the cellular freq.

Hope that helps...Jerry

I'd like to see a scanner like the Bearcats that can not only come with a tone board built-in, but also display the PL tone with the frequency so you don't have to spend even more money on a decoder after just dishing out the $60 for the board itself. The board is useless without the tones to program into it, so the scanner should display the tone with the frequency so that you don't need to guess which tone is being used or buy a tone reader.

Just upgraded from a PRO-51 to a PRO-26. I love it! It has all of the features of the Pro 51 Plus:

1. It gets military aircraft and other freqs in the 200 and 300's.
2. Can turn off the annoying beep everytime you hit a button.
3. Can scan in order of channels or it can sort your freqs and scan.
4. AM, NFM, and WFM modes.
5. Variable steps. Allowed me to program wireless mic freqs.
5. Data skip. Will skip most data transmissions while searching.
6. Hypersearching can be toggled.
7. Review feature allows you to review frequencies you selected to skip.
8. Auto will automatically program a bank of channels to a range of freqs.

On a not totally unrelated note I hope... :)

I've been thinking about getting a scanner for a while to listen to emergency services, aircraft bands, weather etc just for fun. There is an airshow in my city (Winnipeg, MB Canada) this week and I figure now is as good a time to buy as any.

I know very little about scanners and have no experience, so if what I'm after is just not feasible, go easy on a poor newbie... :)

I'd like to get a handheld, portable, battery powered scanner that you could plug into an ac adaptor or car lighter socket if you aren't walking around. I'd like to pick up aviation channels, emergency services, weather, maritime, military, shortwave, hams, conventional broadcast channels plus whatever else is out there, but those are the main ones. I'm not really interested in listening to cel phones, besides as I understand it, you need to do surgery on the radio to get cel anyway.

Here's the kicker. I don't want to spend more than about $100 - $200 Cdn. If what I'm after is available, I'd appreciate if you'd give me the manufacturer and model, pricing, and where I can buy the thing. I sort of assume what I'm after will be a Radio Shack product, which is why I make the assumption I'll be able to get one on short notice like this.

I'd also appreciate any general tips anyone might have for a beginning scanner user. Tips on how to tune in an airshow would also be nice.

Thanks...

Well, the Radio Shack multiband vertical (3 vertical elements) for $29.95
has been a fantastic performer for me. Outstanding performance from 25-900Mhz.

Whatever antenna you get I recommend using ONLY the best coaxial cable,
nothing less than low loss RG-8, but I recommend and use Belden 9913,
same thickness as RG-8 but extra low-loss, especially at UHF. After all,
what's the point of putting up a high gain antenna if you're going to
lose 12-20dB in feedline losses? The Belden cable is very stiff, you will
need to use a short cable like RG-58 (1 foot or less) with appropriate
connectors to connect it to your 2006. You don't want to connect the 9913
directly to the radio unless you support and tie down the cable appropriately.

Andy

I just bought one of these, yesterday, at a pawn shop for $145. Reg.
price i think is 250.
It is a hand held, with 100 channels. I did not get a manual with it and
have been able to figure out most of the functions except for setting
search limits. If you have one of these and know how to make it do this
please write met back.

So far I am very pleased with it. It is not continous coverage and
the 800mhz is 806-823.9375 851-868.9375 and 896.1125-956. It picks
up cell phones but not all of them. I was surprised how many it did
pick up immediatly.

Are there mods out for this model yet???????
kip

4715. Mods for PRO-50

Newsgroup: rec.radio.scanner
Date: 1995-06-09 00:00:00 UTC
From: johnk@news.eecs.nwu.edu
Message-ID: <1995Jun9.151250.10417@telxon.mis.telxon.com>
Source record: 254458

Does anyone have any mods for a RS PRO-50? Is it worth it?

I normally use it for monitoring all 7 Weahter channels while on trips and
for listening to various railroads.

Thanks

The Yupiteru MVT-7100 is a better reciver BUT without RS232 computer interface
all the fun is missing.

Jack.

Source record: 254464

Does anyone know how to clear the memory on BC200XLT??? I've left it
 on without the battery pack for over a week now and it still retains
 all of it's programming. I've had the unit apart for an obvious
(and successful) mod and didn't notice anything that resembled a backup
battery inside the thing. I assume UNIDEN's claim that the memory is
 safe (without ni-cad pack attached) for about 30 minutes is due to some
 capacitor holding a limited charge for the memory. I may be way-off on
 this assumption but really would like to "start from scratch" with
 re-organizing my memory banks. Thanks in advance for any help....

I just got my PRO-43 back from Grove a couple of days ago.

>looking for information on:
>Quality of Service

They fixed the problem (scanner tumbled onto floor and mangled
the power jack and would not power on).

>Price

Reasonable. Like 40 bucks for labor and 11 for parts.

>Turnaround time, etc....

Horrid, but they warned me about it before I sent it in. It took a little
over a month and a half, I think. Didn't matter much to me, since I didn't
want Radio Shack to repair it (and fix the mod), and my wife bought me
another PRO-43 (Un-moddable though :( ) after the first one died.

4724. Thunderbird Freq. at Hanscom Air Show

Newsgroup: rec.radio.scanner
Date: 1995-06-09 00:00:00 UTC
From: "Charles P. Dolan Jr." <chuckpd@tiac.net>
Message-ID: <3raa3s$1d9@sundog.tiac.net>
Source record: 254467

The Thunderbirds just completed their practice show. I gathered the following freq. on my new Pro-26 (Nice Radio!!!)

118.500 Hanscom Tower
121.700 Hanscom Ground Control
236.600 Common Air Show Freq.
413.100 Ground Support
123.400 Golden Knights
134.100
235.250 Thunderbirds
322.950 Thunderbirds
141.850 Thunderbirds
118.200
126.200

Happy listening to all. The Pro-26 is a great radio for any of those who wanted to know. I didn't use the search feature to get these frequencies. I basically verified the numbers given to me by many of you. Also many thanks to those who responded to my earlier inquiry for these frequencies.

Regards

Chuck Dolan

>is worth ALL THAT MONEY!!! Thanks.

The PRO-26 is a remarkable scanner, but check out the Uniden/Bearcat
BC3000XLT. I have both models. The BC3000XLT has twice as many
channels, better audio, better image rejection where it counts,
and skips over empty channels during scan.

The BC3000XLT comes with a unified NiCd battery pack and
wall charger/AC adapter.

The PRO-26 is smaller, has a better LCD display, and can be powered
using alkaline cells, but the smaller keypad is more difficult
to use.

The BC3000XLT street price is about $370 and the PRO-26 price
is about $400. Both are manufactured by Uniden.

AD> Where did I say only law enf. agencies can own cell phones?

Well, when a person says, "The only agencies allowed to own equipment
capable of receiving cellular calls are..."
And each person acts as his/her own agent...
And cellular phones are equipment capable of receiving cellular calls, then
that's what that person says.
I'm fully aware that that's not what you meant. But...
If you can't say what you mean, you can't mean what you say.

AD> Please don't misquote me...

I don't think I misquoted anybody. The quotes are pretty exact above.
Again, I'm sure that's not what you meant to say. There's a lot of confusion
about that subject, and I simply acted to remove some if it.

RE> only want to do it once. So, what is the ultimate antenna setup for
RE> this popular receiver? Seriously, I appreciate all comments and
RE> suggestions from the most experienced users out there. E-mail
RE> preferred.

OK, the best antenna is the one that best does what you want it to do.
So, what do you want the antenna to do?
Some questions:
What is your location RE: signals. In the middle of a large city?
Twenty miles outside a small city? Got hills/mountains?

Do you need directionality?

Do you have problems with pagers?

DO you want truly wide-band reception, or the normal utility bands?
Mil Air? 800 MHz?

All these, and more, will affect the type of antenna you want. A discone
twenty miles outside of Podunk won't do much good, and a dipole tri-bander
in the middle of NYC with a dual-conversion scanner will drive you nuts with
intermod & images.
Do you see the problem? The "BEST" solution for me happens to be a discone,
with a second directional antenna for finer work, both feeding an ICOM
R-7100 through an antenna switch. I have a Radio Shack ground Plane dipole
for other scanners, as well. Each does the same job very differently, to
provide me with the best of available technologies. But that's because I can
afford the multiple antennas, and because I don't want to be stuck with the
compromises each individual antenna has. If you want only one antenna, you
must determine which set of compromises best suits *YOUR* needs.
If you want more 'help', just ask.

The best thing you can do to a scanner to improve reception is put the best antenna you can on it, and raise that antenna as high as you (legally) can. Of course, which antenna is best is the trick!

4731. How do I calculated radials on a groundplane?

Newsgroup: rec.radio.scanner
Date: 1995-06-09 00:00:00 UTC
From: bobszabo@ix.netcom.com
Message-ID: <3ragqm$g3m@ixnews3.ix.netcom.com>
Source record: 254474

Is there a formula for calculating the radials on a ground planes? I think the center verticle element should be cut to the frequency that I want to recieve but I am not sure about the lower radials. I kind of customized a Hustler discone antenna and turned it into a groundplane to reduce the size. I now have the 3 straight upper radials from the discone on the bottom attached to the ground side. I did away with the long drooping radials from the discone. I added a center verticle element, using a multi band mobile antenna. This setup seems to work better than the discone did, even when I tried the discone with the verticle. What I would like to experiment with is the length of my ground radials to see what effect it would have.

JSoft Technologies has a commercial-grade POCSAG decoder for sale. The decoding is done on a 386/486 PC and the hardware component is a surface mounted board in a DB9 serial connector. Here are the specs:

- Displays and/or Stores POCSAG Pager Traffic
- Handles 512, 1200, and 2400 bps POCSAG
- All Alpha and Numeric Data
- Filter CAP Code, Range of CAP Codes, or Text
- VERY low Error Rate - DC Coupled
- Requires PC, and Radio/Scanner Descriminator Connection

This unit was designed for commercial pager shops, although much lower cost than the Hark or other commercial diagnostic hardware.

Pager Datascope, $190 Software Only, $220 Software plus Hardware

From: tcrowell@netcom.com
Message-ID: <tcrowellD9z9oC.BC@netcom.com>
Source record: 254334

I am interested in recieving FREQ information for following storm trackers in the Dallas,Ft Worth, Arlington areas of Texas. We've had some real tuff storms lately and I feel this would be more useful to listening to TV and RADIO (postmortem),

Any help is appreciated.

Thanx

4742. FS PRO 2032

Newsgroup: rec.radio.scanner
Date: 1995-06-10 00:00:00 UTC
From: bv782@FreeNet.Carleton.CA
Message-ID: <D9z9JG.9tD@freenet.carleton.ca>
Source record: 254335

A 5 month old 2032, cell mod completed, 200 channels, freq
coverage of all major areas except NO mil air. Well I've
put some thought into a price and with the constanly changing
Canada US exchange, how about you make me an offer and well
talk: bv782@freenet.carleton.ca
BTW: I'm selling to help pay for my new 2006!

>___ Blue Wave/QWK v2.12
From: jim.kenzig@cleham.nshore.org (JIM KENZIG)
Subject: Here is more info on Pro 2032 mod
Date: Mon, 05 Jun 95 18:33:00 -0400

The mod to expand the rf coverage is fairly simple. Under the RF shield
behind the squelch - volume knobs (bottem of radio) there is a square
chip (1). Diagonally below that (2) are two small rectangular
things lying vertically and then three to the right lying horizontally (3)
Immediately to the right of that is a chip diode which must be removed (4).

Immediately below this diode are three rows of horizontal"double dashes" (5) ,
and just below these a vertical column of 5 "circles" (solder pads) (6).

Immediately to the right of the top two "circles" is a series of verticle
"stripes" : from left to right, three short, one medium and three long (7)

Connect a 1N914 diode between the top "circle" and the third (left-to-right)
short vertical "stripe". Connect the diode cathode (marked with a
black band) to the "circle", the anode to the "stripe".

(1) microprocessor chip, 3/4" square, marked GRE 1908

(2) "below" = toward rear panel. For proper reference position the
chassis upside down with the rear panel toward you.

(3) the first 2 lie 1/4" along a diagonal extended from the lower
right-hand corner of the chip, and are marked 102. The 3 horizontal
ones are in a vertical column positioned 1/16" to the right of
the first 2; the top 2 are marked 107 & 473.

(4) this is a 3-legged diode, unmarked, with 2 of the legs placed to
the right. Remove by unsoldering.

(5) the 1st row is less than 1/16" below the 3-legged diode.

(6) the top pad is less than 1/16" below the 3rd row of "double-dashes"

(7) the vertical "stripes" are actually lengths of copper conductor on
the printed circuit board with a solder pad on each end. The
first 3 (left to right) are so short that they appear as 2 pads
joined together; the copper on the pcb can be seen in the next 4.

I have added clarifying comments to those furnished by JIM KENZIG : many
thanks to him. I have just done the mod on my 2032, and it works !!!

The following brought on a fleeting thought about band allocations in other countries besides the U.S. I know that much the allocation of the RF spectrum is by international treaty. But there are some differences. In the U.S. when we talk about the FM band, we automatically assume the freqs are 88 to 108. But in Japan, and maybe other countries, the freqs go lower, something like 87 or so.

What I thought, is that there needs to be a chart somewhere that tells of the frequencies of the different bands and their allocations. This is easy to find for myself in the U.S., but I wouldn't have the slightest clue about what the airband freqs are in the U.K., as mentioned below.

For those in the English speaking countries, there shouldn't be much problem getting info and trading with other English speaking countries. But others, I dunno.

I can make some blanket statements about band allocations, mainly pertaining to the HF and below. They're pretty much the same worldwide, so that different services will work worldwide. But starting at 30 MHz and up, things are somewhat different from country to country. Such things as the TV bands are different because they use different transmission methods. U.S. TV channels are 6 MHz spacing.

Is there some place where we can go to find out this information? Say I'd like to know what the airbands are in the U.K. - can I just find a ham directory on a U.K. system with info on their band allocations? Probably not?

Back to the following. I bought a Radio Scrap Patrolman radio, long ago when scanners were rare and expensive. This is a multiband radio that has FM BCB and VHF HI, LO, and UHF. The same FM detector and IF is used for all four bands. The VHF and UHF bands are practically useless in this metro area bacause the bandwidth is so wide that multiple stations come in on the receiver. There is no way to tune it accurately. So yes, the following situation is very true.

You can scrounge a UHF tuner from an old TV set and connect it to a 9 volt battery or other power supply to get it running. Then feed the downconverted output into another receiver to get enough gain to hear a reasonable signal. You won't be able to set it accurately, since the tuning is just too sloppy for narrowband FM. But you can play around with it to see how it works. And the price is right: free. The old tuners were analog mechanical designs, with the capability to tune to CH 83, which is on the high end of 800 MHz. The newer tuners are all electronic, and can't tune higher than Ch 69.

Andy Dingley (dingbat@codesmth.demon.co.uk) wrote:

: > literature describing converters ("downconverters") which perform a
: > fixed-frequency downconversion of 902-928 MHz signals (or other high
: > frequency transmissions) for receipt and tuning by a standard FM radio?

: You'll be lucky....

: 88-108 broadcast band radio is not only a different frequency, it's a
: different modulation standard; wideband FM, rather than narrowband FM.
: Although you'll probably hear *something*, the quality will be near useless.
: As the deviation of your converted signal is so small, relative to what the
: broadcast receiver expects, you'll get a very low output. The bandwidth of
: the broadcast radio is so large that you might have problems with co-channel
: interference (it lets two adjacent channels through, not just the one you
: want). Finally, the tuning control of most domestic broadcast receivers is
: pretty vague and wooly.

: You would be much better off feeding your the output of your downconverter
: into a better quality receiver, maybe a cheap scanner or airband receiver
: that does FM. It needn't be expensive.

One of the crazy things I do is pyrotechnics - yes the big 4th of July shows. We use handhelds for crew communications, and we also have a noise problem. One trick we've used is to buy a GOOD pair of protective ear muffs (like the David Clark ones) from a safety catalog, and to put small speakers (8 ohm 1 or 2 watt) inside them, then wire them to a dangle-type stereo jack hanging from one side. Why stereo? the left headphone is wired to the crew radio, and the right side to a scanner programmed to the fire channel (there is always a fire engine on site at our shows - we determine the on-scene channel they use, and program it in - either the crew boss or the fire chief can get _everybodys_ attention and stop the show).

Anyway - if you need to use a standard radio at a loud event, that's what I'd do. Why add more noise (with an amplified scanner) - your ears can only take so much before they get damaged....

Glen:

I'm glad you enjoyed your visit to the Los Angeles City Fire Department's WWWeb Pages. Thanks for visiting.

Our Department is proud of its commitment to monitoring enthusiasts. To the best of my knowledge we are the only public safety agency to post its radio frequencies (PL's & all!).

Please know that some fine tuning and formatting are underway.... with lots of neat surprises planned for scheduled updates.

More than just a frequency list, you can visit the LAFD anytime at our URL:

http://www.ci.la.ca.us/department/LAFD/index.html

Once again, thank you for your interest in the Los Angeles City Fire Department.

Mike
It would be real helpful to yourself if you told us what kind of scanner

you got.Brand and model# is a good start.There is probably a a decal or

plaque on the back that can tell you this.If the radio is a radio shack

product it will say PRO-## If its bearcat/uniden it will say BC-###

Is this scanner a portable(walkie talkie)type or is it a base/mobile unit.

You can increase the range by using a decent external antenna.Let us

know what you got so we can help you out a little better.You might want

to read the other post in these newsgroups to get an idea on what is

possable and not possable in the world of scanning.

Take care,

Mark(MR.NEWS)Jeannette

My friend needs a handheld scanner that will recieve the 200-400MHz
military air band. I believe that limits him to a Pro-43, BC2500XLT,
BC3000XLT, Pro-26, IC-R1, MVT-7100, or an AR8000.

I know the fancy ones are expensive, but he doesn't need
many of the features of the MVT or AR, nor does he need cell
coverage. Hopefully, somebody out there has something he could
use that won't cost a fortune.

Please E-mail me if you have one of these radios for sale.

Thanks,

Victor

Is there anywhere a repository of information on various states and countries
laws relating to the personal possession and use of scanners.

Such as...

USA can listen to anything except cellular radio, though some states may have
a mobile usage ban. New scanners must have a cellular phone block out.
Of course it doesn't help that the US 33cm band is the place that the UK keeps
it's cellular phones!

or

UK, no hardware limits but can only listen to ham, broadcast, cb and (when near
the coast) coastguard.

I'd hate to arrive at some airport and have my $400 plus scanner removed
legally.....

Thanks in advance

Nigel

Try 153.830. They might use that for firegound portables. Also the
Huntington fireground freq. is 46.42. These freqs. would be used for
communications at the site of a fire. You wouldn't get much on either of
these two if you were too far from the site where they were being used,
however. Huntington. Halesite & Centerport aren't currently licensed for
any other freqs. as far as I know.

This is a good plan.

Are David Clark ear defenders any good ? The David Clark aircrew headsets have two reputations; one for being excellent quality, and secondly for being damned uncomfortable. They're not known as "head vices" for nothing !

My own intercom sets (I have a bunch that I use for flying, motor racing, and noisy ex-military vehicles) use a variety of converted headsets, but my favourite set are made from Peltor green ear defenders (Peltor are colour coded - green are the deepest domes & highest attenuation) fitted with the hardware from a UK army surplus "Clansman" headset. Clansman sets are designed to fit under an infantry GS helmet, so they have no noise attenuation of their own. They're not the greatest for speech quality, but the boom mike is a noise cancelling dynamic, and copes pretty well with high background noise. It also fits on a single hole mounting, so it's easy to do the conversion. The earpiece looks like a standard telephone receiver 4T (UK phreaks will recognise it), but the impedance is lower. I usually wire to a 4 pole NATO helicopter jack plug. Helicopters use a single plug, fixed wings use two. Although I fly in fixed wings more often than rotary (and not enough of either), it's neater to adapter-split a single lead into two, than it is the other way around.

For many motor racing events (I don't know about Indycars), just using a pair of Walkman headphones is all the extra volume you'll need. Ask yourself if you'd normally be wearing earplugs to stand there, and if the noise levels aren't irritating enough on their own, then just try the light headphones.

Well, there IS newer software available, but no, it doesn't have the ability
to control the MR8100. The MR8100 can not be computer controlled, the ONLY
thing you can do via the serial port is upload & download radio memory.

The software is Scan*Star, and you can check it out:

http://www.scanstar.com/ or BBS:1-408-258-6462

Demo versions are available via either of these methods.

Scan 460 - 460.5 for most all of the Chicago PD freqs. They tend to be very busy so you won't have any trouble spotting them.

Also try 856.9375, 857.9375, 858.9375, 859.9375 and 860.9375. These are drug stakeout surveilance freqs. They are trunked so scan them all.

>while I'm working.

Telvision channels in th U.S. range from 50 to 800 MHz. Most home VHF/UHF televison antennas (the directional ones many of us have on our roofs) are log periodics and should be "resonant" everywhere between the television frequecies they are inteneded to receive. However, televison stations transmit at significantly higher power than than most land mobile stations - so what makes an efficient receive antenna for TV may not be that efficient for monitoring mobile two way.

I have often wondered what kind of "scanners" people are using when I hear that they are receiving TV audio. Higher end monitoring receivers can select between FM and FMn - but hooking your average hand-held radio shack scanner to a TV cable would likely result in nothing since any audio programming is going to be way too wide.

Completely different design, different product. JSoft emulates the
commercial units (Hark, etc) and requires DC coupling into the radio's
descriminator. The JSoft unit also is a full bit datascope to monitor
sync patterns, etc...

>does that switch do?

The Electra/Bearcat 20/20 is a 40 channel scanner, a slight
refinement of the earlier 20 channel BC-220.

The A/B switch selects between two sets of 20 channels -- hence
the model nomenclature "20/20". The channels in both sets
are labeled the same, 1 through 20. Each channel set is further
divided into two banks.

>and what part numbers would I need? Is there a catalog of part numbers
>somewhere?

Jan:

You should really order a PRO-43 service manual from your
local Radio Shack store because it costs only about $10 and is
a great help. It contains a parts list, exploded assembly diagrams,
schematics, alignment data, etc.

Manufacturer part numbers:

front case assembly is GA-91D-9416.
front case alone is GE-91A-9207.
LCD window alone is GE-91C-9208.
LCD is EDD042ZX1A4.
reflector behind the LCD is GE-91D-9209.
interconnection strip between the LCD and circuit board,
is GE-91D-9210.

Since the shipping & handling charge is usually $4, sometimes
it makes sense to order several parts if they are cheap and you are
not sure which one you really need.

While ordering parts from Tandy, sometimes the manufacturer's
part number is not enough, they require a Radio Shack part
number. Unfortunately, the R/S part numbers for those
parts are not listed in the manual, but the Tandy folks can help
if you give them the information in this posting.

If you don't want to deal with your local Radio Shack store,
you could try calling Tandy national parts at 1(800)843-7422,
but I haven't tried this number.

NOTE: I cannot supply other part numbers, I just happen to
have the PRO-43 service manual close by.

I'm new to this group so if this is a well worn question please bear with me. I have an old Radio Shack Pro 31 scanner that I use almost exclusively for monitoring the local railroad frequencies (160. 161.). Most of the time I'm walking through mountainous (lots of tunnels) and forested areas at least twenty miles from the transmitter. Needless to say, reception is not great. So my question to you is this: Are there any of those rubber antennas made for specific freq's, or are there any other ways to improve reception in remote areas. Thanks for the help.

Hello everybody,
I have Sony 2010 and Pro-39 which are great radios. I am wondering if
it would be a good idea to buy the receiver with the HF-UHF coverage like ICOM
R-100 or something like that. The main reason is because of its small size.
How good is that receiver in compared to the handheld scanners?
Any responses would be greatly appreciated. Please post or reply.
Thanks for your consideration.

>frequencies they use?

To the best of my knowledge, there are no SFPD officers using bicycles. We have "meter maids" that use bikes, but they've been demoted to their own play-pen in the city bureaucracy - the (drum roll) Department of Parking and Traffic (DPT). Seems the armed cops were getting tired of rolling units to handle blocked driveways, etc.

Bundy Chancok answered

>They'll be anywhere from PIC 1-PIC 12. Generally, they hang out
>on PIC 8 (460.550).

The police (and other organizations) don't "hang out" on freqs as they please. San Francisco is divided into police juridistictions - I for example, live in the Haight, in the "Park/Northern" division (assigned to PIC 4, 460.075).

According to the nice folks at the SFPD radio room, PIC 8 (460.550) is assigned to Vice/Narcotics. PIC 7 (460.525) is assigned to DPT.

Enjoy.

Good question. If you just happened to be 'passing through' this area of
the band, you may not be in any trouble. I have read reports like yours
all the time in Monitoring Times magazine. Never heard of anyone being
prosecuted for turning over a tape of a crime in progress.

4805. AR8000 EDCO Interface !@$!#%

Newsgroup: rec.radio.scanner
Date: 1995-06-11 00:00:00 UTC
From: jbrooker@falcon.ic.net
Message-ID: <3rdref$iec@condor.ic.net>
Source record: 254354

My EDCO interface cable appears to have failed AGAIN. Several weeks ago I returned it to EDCO. It was returned "No Trouble Found", although it did work upon return. (They added hot glue to the point where the flat cable exits the RS232 connector for restraint).

Worked OK for a couple of weeks but it now appears to have died again.

Guess based on what I've been reading here that it would make sense to order the Opto CX12AR interface.

Except I'm now wondering if there's a method of testing to see whether the problem with the EDCO interface is the interface cableor whether it is the flat cable connector in the radio.

There is only ONE solution. "An outdoor base station antenna. The higher
the better". Signal amplifiers also amplify noise
and therefore are not very useful.

In article <Pine.ULT.3.91.950610195445.20354A-100000@bert.cs.byu.edu> you write:

> I recently tried hooking up my TV cable to my Pro-46 with a RF to BNC
> converter. I couldn't get any reception. Could anyone please tell me why
> this doesn't work? Shouldn't I be able to get great reception at _some_ freq?

Do you mean "cable to my TV antenna", or "cable TV" ?

If you connect a scanner to a TV antenna, you will get a better signal for signals around this band, and in the same direction as your TV transmitter. US TV standards are different from UK, so I don't know the frequencies offhand. I often do this myself to hear the TV news or documentaries while I'm working.

If you live in a building with a shared antenna and TV distribution amplifiers, then the strong signal may be overloading your scanner's front-end. Try switching in the scanner's attenuator (if it has one).

If you're connected to a cable TV outlet, then there isn't much hope. You could pick up the cable TV sound carrier, but you'd need to know how it was modulated. I don't know this information offhand (US is again different from the UK), but all you could hope to get would be the cable sound channels. As an antenna for scanning, this would be completely unworkable.

TV antennas aren't much use for scanners. It's not an exciting band, and the TV signals are usually strong enough to pick up with a rubber duck anyway.

In Oct 1994, they updated the ECPA to include Cordless phone monitoring
as an illegal act... just like the ECPA did to CELLULAR phone monitoring
in 1986...

But, then, the police routinely give criminals the freedom to commit crimes,
as long as they inform on other criminals.....

Mine has a range of approximately 10-15 car lengths, which is ideal--any more range and you'd miss seeing reactions!

I initially had a similar experience to yours--it worked OK, but had extremely short range. I finally experimented with trimming the stripline antenna a bit (make sure to do it in extremely small increments!) and tuning using a borrowed radar detector. I eventually reached a range easily in the hundreds of feet, with the tuning pot exactly midrange. Careful adjustment of the stripline may yield similar results for you. Instructions on tuning the stripline are in the assembly manual. Good luck!

4825. Replacing LCD on Pro43?

Newsgroup: rec.radio.scanner
Date: 1995-06-11 00:00:00 UTC
From: jek1@crux2.cit.cornell.edu
Message-ID: <3rfgrn$3tk@tuba.cit.cornell.edu>
Source record: 254374

I need to replace the LCD on my Pro43 scanner. It seems that it is securely glued to the front part of the case. Has anyone done this before?
If so, do I just replace the LCD only, the whole front part of the case, or is there some other method?

Finally, what is the phone number of the RS replacement parts place, and what part numbers would I need? Is there a catalog of part numbers somewhere?

Thanks in advance,
Jan

4826. Where to buy Opto CX12AR?

Newsgroup: rec.radio.scanner

Yes, I used one. It was very good in rural areas. Lots of intermod in NYC, however.
A problem: It had a bug where you can't lock out the preprogrammed freqs: In other words, if you get a data channel on 800 mhz, you just keep stopping there, no matter what you do. Mine is back at Uniden as we speak, getting the bug a dose of RAID.

>scanner.

Well, I have the SC150, and it's a nice scanner. The only problem is that
nobody has any mods for it!! I guess that it's too new for someone to come
upon a junk SC150 to take it apart to find some mods for it... Other than
that one small detail, I like the SC150 very much!

Dear all,

I am pretty new to scanning, so please be indulgent.

Firstly, I just been given an ICOM IC-R1 receiver (that where all started...). Is it any good ? Any advise as of where I could find some info about it's use ?

Next, I am living in Switzerland. Any idea of where I could find frequencies lists ? Are there any international standards I could start with ?

Any response appreciated

I was not "calling you a liar". You may, however, be misinformed.

The only equipment that Radio Shack has had to remove from the shelf has
been a couple of models (manufactured after the cutoff date) that turned
out to be relatively easily modified to receive cellular transmissions.

The FCC has not required the removal of radios that were manufactured
before that date - although it appears some managers somewhere in Radio
Shack required it of their stores.

I have also not seen, nor would I expect (given the differences in dollars
available), any attempt by Radio Shack to fight the law - in the first place.
They certainly did not do anything to make sure as many radios as possible
were available. If they had done that, there would be a warehouse full of
PRO-2006s and PRO-43s - all manufactured and imported before the ban date.

I'm getting ready to order the OS456 in 2-3 weeks and have
picked up the 4 major software demos I know of

Radio Manager
Scan Wear
Scan Cat Gold
Scan Star Commercial

Also I heard about another program called Probe
I would like to check out them if they have a demo.
Is it a Dos or Windows program and what features it has and the cost.

If anyone has any info could you please send it to me or the location
of the demo if there is one.

Thank-you

Steve (N3FWE)

Hi! I was wondering how much a small, inexpensive UHF radio would cost me. All I need is to have one frequency (453.350) and it doesn't have to be a powerful radio. I currently have a scanner but I'd like something a bit smaller, and more portable just so I can monitor that one frequency. That's the reason it doesn't have to be a powerful radio - just so long as it can recieve transmissions. I don't know too much about radios and stuff so if there are any other options you folks can think of, I'd appreciate them! Even something like a used Motorola Minitor II might do the job. I'd appreciate any advice I can get! Please respond via E-Mail at sachinp@execpc.com. Thanks in advance!!!

4839. Re: Should I buy ICOM R-100 for HF/VHF/UHF ?

Newsgroup: rec.radio.scanner
Date: 1995-06-12 00:00:00 UTC
From: Paul Campana <pcampana@omni.voicenet.com>
Message-ID: <3rged9$ha3@news.voicenet.com>
Source record: 254258

I have a R-100 and it is a pretty good scanner depending on the pupopse of your use.It has excellent sensitivity but is very prone to intermod due to it's wide band design. It's shortwave
audio is ok if you are only a occasional listener. Nothing substitutes a good HF reciever. If you
have freqequencies programed in different bands, it will make an annoying click when changind
bands while scanning. Same goes for if you have the preamp on one channel and not annother ,tthe
reley will click on and off. As far as recommending one, I 'll leave that to you.It is expensive
and does have its shortcomming but is a hell of a scanner commpared to some of the other scanners
out there. I ordered an AOR scanner and sent that piece of trash back. I purchased one of the new
Bearcat 500 channel scanners, but sent it back because as it scanned you could hear a AM radio
station that is 15 Mi. away in it's speaker.It was also plagued by intermod that was pretty far
away. Overall it is better then anything that I have seen lately other then commercial eqquipment.

In article <3rfcr9$k1u@warp.cris.com> George Josol, gjosol@cris.com writes:

>Does anyone know about the version 3.1 of Optoeletronics Scout series?
>What is the difference between that version and the last version?
>thanks everyone! george-

Version 3.1 is the first in multi-lingual Scouts. Version 1-3 can only output CI-V commands. Upon startup with a 3.1, one can select AOR mode, allowing Reaction Tuning on a hand held for the first time. With all the 2-ways supporting some type of serial interface, who knows what radios they may support in the future.

Oh, because of the differences between 3.0 and 3.1, upgrades ARE NOT available. For those with a v1-3 Scout however, Opto will be releasing shortly the ARCX cable for around $37. This adapter will translate CI-V commands (from the Scout) to an outgoing AOR command (to the AR8k/2700).

Hope this helps....

Probe is manufacture by Datafile out of St. Louis, Missouri.

Unfortunately, there is no Demo of Probe available. I own a couple
Radio programs and Probe is one of them. Probe has been designed
specifically for the OS456 (and soon will support the OS535).

Because of pending litigation with another software manufacture,
(NOT Datafile, Signal Intelligence, or Computer Aided Technologies),
I hesitate posting pros/cons about any radio control software.

I received a postcard from Datafile a couple of days ago regarding
their new email address. I can't find it right now, but I believe
it was DATAFILE@GENIE.COM. They do check in at Compuserve from time
to time, but I know they frequent Genie. Try that address for more
info. If it is not valid, email me and I'll get the correct address.

Additionally, I do know they offer a money-back-guarantee, which
helps since a demo is not available.

I picked mine up at Dayton. First, when you contact companies, make sure they are selling the current version of the CX12....the CX12AR!! Another user ordered one and received the old product which would only work with CI-V devices.

Try the following for pricing/availability...

Lentini Communications 800-666-0908 or 203-666-6227
Tucker 800-527-4642
EEB 800-368-3270

Additionally, I have recently come across another fellow on the net that carries Opto products. He is selling it for $88. The company name is Erik of Advanced System Concepts. Contact him at 206-NEC-APPLE or email: Erik@U.Washington.Edu.

Don't forget to ask about shipping charges, returns, etc...

Hope this helps...

Hi Dave

I did a modification on my MX7000 scanner to increase the scan speed about 6 months ago. This was accomplished by changing the value of a small disc ceramic capacitor on the display board. I got the instructions for the modification from a FTP site - I can't remember which one. If you want, email me and I'll whip the lid of my set and let you know what capacitor it is.

I've not seen any modifications for increasing the channel memory. If you hear of any, manage to get a schematic diagram please let me know.

regards

Alistair (G7GAR) Malvern, England

4853. short wave on a scanner

Newsgroup: rec.radio.scanner
Date: 1995-06-12 00:00:00 UTC
From: Dan Bjarnason <dbjarnas@toronto.cbc.ca>
Message-ID: <3rh81q$48g@noc.tor.hookup.net>
Source record: 254272

i want to pick up short wave on my scanner. is this do-able?
what freqs shud i scan ... and shud it be in fm, or usb or lsb?

does it require a special antenna, or will the one that came with
my scanner (a yupiteru) do the trick?

many thanks ...

4854. Bearcat 150Y (or SPORTCAT) modification??????????????????????

Newsgroup: rec.radio.scanner
Date: 1995-06-12 00:00:00 UTC
From: rmachow@chemeng.chmt.wits.ac.za
Message-ID: <rmachow.33.2FDC6C25@chemeng.chmt.wits.ac.za>
Source record: 254273

Hi there folks,

I have two hypothetical questions:

1. Can ANYBODY help me with the modification of the Sportcat (BC150Y) to receive between 54-76MHz range? This is the Ambulance Frequency range is South Africa.

2. Does anybody have any ideas how I could unscramble GSM cellular network signals which I am picking up here in the Republic of South Africa on the 450MHz range? I can hear the people talking, but it is quite muffled. It sounds almost like listening to the normal radio signal in an Upper or Lower Side Band Mode.

ANY information, will be greatly appreciated

ROB

4855. WTB: Kenwood TH-79 (not AD)

Hi...

I just use one of the CD to cassette adaptors that plug into the headset jack of most scanners. Provided your car stereo has a cassette player. It works pretty well, although if your stereo cranks it can sometimes blow you away! C-Ya.

It depends on the department and the capabilities of their equipment.
But yes, many agencies and commercial users, that are encrypting, use DES
encryption. Lesser capable folks might use inversion, etc.

4867. Groves Shortwave converter? Any Opinions?

Newsgroup: rec.radio.scanner
Date: 1995-06-12 00:00:00 UTC
From: tbohr1@ed8751.pto.ford.com
Message-ID: <3ri1jr$p14@ef2007.efhd.ford.com>
Source record: 254286
Cross-posted to: rec.radio.scanner,rec.radio.scanner

Grove has in their current lineup something called "shortwave converter" that can attach to certain scanners and tune much of the 3-30Mhz shortwave band. It lists for $99 US. Anyone tried this and if so what do you think? Its theory of operation seems to be similar to the "scanverter" that brings 800Mhz down to 400Mhz.

Thanks.

Ltdardstar,

Ramsey Electronics in Victor, New York sells such kits in the ~$40 range.
Enclosure for the kit is ~$15.

Grove Enterprises, 1-800-438-8155, sells the GRE 9001 SuperConverter for
~$100 including S&H. The GRE 9001 is sold specifically to enable the
entire 800 MHz band.

Hope this helps.

4871. Spread Spectrum

Newsgroup: rec.radio.scanner

From: Joe Balenzano <jpb@dart.thomsoft.com>
Message-ID: <DA2qwv.15K@thomsoft.com>
Source record: 254290

Many of the 900Mhx cordless phone advertise that their phone's
use Spread Spectrum technology.

Questions :

What is Spread Spectrum ?

If a phone is using Spread Spectrum, can someone still use a scanner
to listen to a conversation like one can with the 46-49 Mhz phones ?

If a 900Mhz phone does not employ Spread Specturm, is it a correct
assumption that these 900Mhz phones can be scanned like 46/49 Mhz
phones ?

Now I just have to get myself an 800 MHz capable scanner, and find my way to LA so I can monitor this fire department I've read so much about on the Web!

I read in the "communications center" section of the page that LA sends voice dispatches to the stations via dedicated phone lines. Does this mean that the only dispatches that go out via radio are dispatches for units that are not in quarters at the time of the dispatch?

I apologize if this question is "prying" too much. I was just curious as to how the dispatchers handle the radio vs. phone line decision in LA.

I hear stuff from upper NY and VT all the time from Ottawa, Canada. This is around 150+ air miles from here. What do I hear? Tankers, Pireps to ground stations, and my favourite "Furballs" there is a lot of air combat training by both the Syracuse ANG and the Burlington ANG. This stuff can be real exciting, don't expect to hear the ground stations, but airborne stuff can pound in, esp the AWACS a/c. So check it out

Fo> Thanks for the post. I have an R7000 that does the same thing. Never
Fo> have had time to look into it. Whine lasts only about 15 minutes and
Fo> then once its warmed up its OK. ICOM may have a service note on this.
Fo> If you find out anything please let me know.

Have R7000 that also whines at some times. I believe it was comming from
the display unit, if I put pressure on it I could eliminate the whine.
This was done with the top cover off to access the unit. Icom has a
SB on the display unit that had some componet changes to correct the
problem. If one day you switch the radio on and there is no display
then likely you have a dislay unit failure or DC to DC converter failure.
Since the R7100 uses a LCD display rather than the floresent dislay
I would expect the whine is a different problem.

Cheers Ted

<bruce.langos@daytonoh.ncr.com> wrote:

> Where can I get one of these?

There has been much discussion on the Highway Zapper issue as of late. To catch everybody up on what has been discussed I am compiling a list of some of the highlights of this discussion from the past month or so from various sources on and off the net.

--- What is a Highway Zapper?

A Highway Zapper, also known more loosely as a radar activator, is a small garage-door-opener-type of device that, when the button is pressed, sets off radar detectors that some drivers use to attempt to avoid tickets. Naturally, if the other driver thinks that they may be going too fast, will slow down to "normal" speeds. They are generally available for about $50 and run off a 9v battery. There has been some questions about legality of using these devices as well, but it looks good if reasonable power limits are used. There are also some alternative things to think about using for those that want to home-brew their own radar activator.

This is the point where most everybody has an opinion, and the discussion falls into a flame war about speeders. We aren't going to do that - it's been done to death. The basic points to these arguments are 1) speeding is bad 2) stopping people from speeding is bad. 3) You are a pickle-headed moron. 4)You suffer from cranial rectal inversion. Repeat ad nausium. My personal reflection on this is that anybody who publicly flames immediately loses all dignity and respect in the net community no matter what their point.

Message-ID: <DA2yD2.8HM@ntmtv.com>
Source record: 254305

Joe Balenzano <jpb@dart.thomsoft.com> writes:
> What is Spread Spectrum ?

It's where the radio energy is spread across a wider slice of frequency spectrum than is usual or normal. Unlike with "normal" trasmissions, there is no thin slice of spectrum that when you tune to it, contains most of the transmission's energy. With it spread out, the theory is that there is so little of the signal present at any given frequency, that you'd need special equipement just to receive it.

With some spread spectrum schemes, not only is the transmission spread, but it constantly hops around in a random-seeming way!

> If a phone is using Spread Spectrum, can someone still use a scanner
> to listen to a conversation like one can with the 46-49 Mhz phones ?

Not likely. That's part of the idea behind spread spectrum. There are also other concepts that involve getting more use out of the spectrum--even so that multiple spread spectrum users/transmitters can overlap to a certain extent.

> If a 900Mhz phone does not employ Spread Specturm, is it a correct
> assumption that these 900Mhz phones can be scanned like 46/49 Mhz
> phones ?

No. It could be a non-spread spectrum digital phone. In this case, you'd have to figure out how to decode the data before you understand anything that was being said.

>my scanner (a yupiteru) do the trick?

Shortwave generally refers to the 3 - 30 MHz spectrum.
International shortwave broadcasters use AM (amplitude modulation)
and many utilities use SSB. Most scanners lack an SSB product
detector.

For AM reception, you will need a convertor with your scanner.
A simple convertor consists of an oscillator, a mixer, and some
tuned circuits.

Now here's a trick -- You can get a head start if you have a 49 MHz
baby monitor transmitter and your scanner can receive in AM mode
in the 30-50 MHz band.

Connect your scanner to a shortwave antenna (e.g., 50 ft. elevated
wire), turn on the the baby monitor transmitter and place it
near the scanner.

It's not uncommon for the 49 MHz energy from the baby monitor
to beat with shortwave stations and mix inside the scanner. The
difference in frequency falls within 30 - 50 MHz range. The baby
monitor is acting as another local oscillator and the mixing
takes place in the front end of your scanner.

The scanner will tune shortwave "backwards:"

- A 15 MHz shorwave station will beat with a 49.83 MHz
baby monitor and might be received on 34.83 MHz
(34.83 = 49.83 - 15).

- A 17 MHz shorwave station would be received on 32.83 MHz.

You will have to "adjust" the distance between the baby
monitor and scanner for best performance. Although this
doesn't make for a very sensitive setup, I have received
international broadcasts from all over the world using
a baby monitor near a BC9000XLT. I prefer using the NRD-535D, though :-)

From memory me neither but different value's wil result in different
"speeds". Be careful though not to go too fast as the PLL circuits will
not lock up which will mean you will hear "clipped" transmissions but
the radio will not stop on that particular channel/frequency.

Shortwave receivers usually have a range from < 1Mhz to about 30Mhz. Most scanners do not receive in this range and those that do usually do not have near the sensitivity nor selectivity of a real shortwave receiver.

In any case, if your scanner can pick up that range you will want to connect it to any long wire and you should be able to pick up commercial shortwave stations fairly easily(especially, I assume, that you are in Toronto). I you want a fairly cheap list of frequencies, pick up the latest issue of Monitoring Times. Initially stick to the BBC, Radio Netherlands and, of course US and Canadian shortwave stations. I believe that the BBC has a relay in Newfoundland, so it should come in fairly strong for you.

Good luck and enjoy.

I still have several "RS-232 repeaters" that are easily modified to
work as an R7000 to serial interface. Each one includes a power
supply, DTE and DCE connectors LED status lights. The mod involves
adding 1 wire and the cable to plug into the R-7000.

For $25 I will send you the repeater, mod, and a simple C program to
load up the memories from a text file. For $5 more I can xerox my
programming info.

: Which has the most choice for compatible software?
: What software would you recommend?

: gjacek@cyberstore.ca

Try the Optiscan 456 (US $280) and software like ScanStar Pro (US $80).
Both are available from Grove at 1-800-438-8155.

I have a PRO-2006 with the OS456, and ScanStar and ScanCat. The only
advantage that ScanStar has, in my opinion, is the spectrum analysis,
which is VERY neat.

REVIEW: by Charles Lowrance WA4MCK

ScanCat-Gold-Ver 6.
Computer Aided Technologies
P.O. Box 18285
Shreveport, La. 71138
1-318-636-1234 Order Line.
1-318-686-0449 Fax 24 hour.
1-318-687-2555 Live tech support.
9 AM. 1 PM.CST
NiteTime BBS
1-318-631-3082 7 PM. 6AM.CST

For 35 years now, radio communications has been my main interest-anywhere from Low end broadcast to satellite TVRO. When I saw advertisements in most of the various communications magazines I was immediately interested In all the different scanner control programs, and downloaded most of them.
I also downloaded the Scancat demo program from the NiteTime BBS.

SETUP:

I was very impressed with the simple start up and the ease of use. It did not take a manual to get the gest of the programming procedure, and by the way the manual does have a great index if you do need help.
Scancat Gold is almost 2 Megs of files, and must be run from the hard drive.
The opening screen show the main menu and it's divided into sub-menus - each controlling certain aspects of the radio that it is interfaced with.
The selection of your radio is the first instruction. The list of support radios was well over 35 radios It covers Icom, Kenwood, Yaesu, AOR, R/S Pro2005/2006 and the OS456 plus many more.
Menu (A): invokes a sub menu that allows the input of data such as frequency , Mode , Step size.
One feature that I like is you can change the Mode (AM, FM, SSB, CW) with a single keystroke. I like that, you can also change the frequency with the UP/DOWN key.
Scancat Gold also gives you a great looking radio control panel screen view of what your receiver is doing, such as Frequency readout, Mode, Step size, and Relative signal

strength.

FEATURES:

Scancat Gold will allow you to create/edit/merge up to 15 files. This feature would let you custom create individual files. Example one for Ham radio, Shortwave radio file, VHF air band, etc. As you can see, the files that you can create are almost unlimited. This will let you program your receiver and it makes the radio/computer interface give you the full control that makes scanning a much more exciting experience. I found myself staying up late and trying to push the system to the limit. Another great plus with Scancat Gold is the ability to control your TNC like the MFJ-1278 or the PK-232 plus others. Scancat Gold can now give you full control of your receiver/scanner, plus your TNC automatically.
Just think-load a file-say the 20 Meter band, and you can copy RTTY-PACKET-CW or any other mode that your TNC will support.
Scancat Gold also has a spectrum analyzer built in that works very well I had a lot of fun with this feature.

SCANPORT:

This Utility is also included with Scancat Gold. The Utility will let you import frequency files from say a BBS frequency list, CD-ROM file, Ascii text files, plus many more, and Scanport will convert them automatically into a file that you can load into your receiver. Scanport will even remove dupes from the imported file-one great time saver. For those of you that don't like editing frequency lists for your computer control program to use with your receiver. You save time because now you don't have to enter each frequency, and the mode manually. Boy, how many hours have I spent doing just that.

SCORE CARD:

Scancat Gold Ver 6. is well worth the price of $94.95. It more than makes scanning the fun it should be. I did not find any other scanner control program that would even come close to the power of Scancat Gold.
Mr. Jim Springer the author and programmer of Scancat Gold is personally available for live tech. help at his Tech line phone number 1-318-687-2555 9am to 2pm CST Monday - Friday.
There is so much more about the program that I wish I could tell you about but it would take many more pages.
A must for anyone that love to monitor the radio spectrum.
I rate Scancat Gold Ver. 6 with a big A+

REVIEW: by Charles lowrance WA4MCK

AOR8000INF Interface cable.

Like most people I know, I too have the problem of looking for the best, the fastest, or the one that has the most bells and whistles for the money.
Well I just had to have the AOR8000 scanner/receiver after looking for months and reading about all the other neat scanners out there. So, with some "what if's" in the pit of my stomach the decision was made to purchase the AOR8000.
The unit came the next day and like a kid with a new toy I started jumping from one frequency to the next. I was not disappointed at all with the AOR8000, it did all I could ever want in a receiver; it has sensitivity, selectivity, and very good audio. the unit would be used for shortwave VHF/UHF Military air, and SCPC Single Channel Per Carrier - this is on the geostationary satellites frequency 950 MHZ to 1450 MHZ The format carries programming from all parts of the world.
I also wanted a receiver that had the frequency coverage --- DC to Daylight and all modes.
But after spending $600.00 for the AOR8000 I just could not see myself spending $100.00 for the (AOR8000INF) interface cable, and then around the same amount for the scanner program. All I could think of was noise in the interface cable, and a scanner control
program that took a "Rocket Scientist" to get working.

The AOR8000INF CABLE.

My first impression with the cable was the setup. I found it easy, it connects to your serial port 1 or 2 on your computer, and the other end to your AOR8000. I could not find any computer noise - even when tuning the radio to the computers clock frequency. The unit itself is small - about 8 inches long. The cable is constructed very well, but I do believe that the cable is a little over priced.
I do not believe that the cable is durable enough for everyday use involving connecting and disconnecting, For you could ruin the cable If you should bend the cable more than a few times, as the cable could break inside. I think a better cable would be made of shielded flexcable with a stronger cable to radio connector..
I do have to add that the cable is a must if you want to interface the PC control programs to your receiver.

And at this time this cable is made for the AOR8000.

^^^^^^^^^

Has anybody actually done this? It seems silly that the unit would have a diode whose only function is to SLOW its "hyperscan" rate. Maybe I'm just being overly cautious, but can someone, ANYONE, who has actually performed the D503 diode mod successfully please e-mail me. I just want to make sure it's kosher before I start snipping.

Thanks in advance!

Mark

><drice@asu.edu>

David:

You are not prying. Service to the public is what we are all about! When you do come to Los Angeles, please let me know and I'll be happy to offer you a personal tour of our communications center (OCD).

You read correctly. More than 120 separate LAFD locations over an area of nearly 470 square miles are connected to our OCD by way of separate and moitored 56K lines. While we refer to these as "telephone lines", they are more correcclty identified as "data lines". The verbage that was included in the OCD page was from when we used twisted wire pairs. These are triple redundant (twisted wire pair and microwave) and supervised.

Do bring your scanner to Los Angeles. What others have heard and what you will hear is a SIMULCAST of a portion of the audio that we "ring in" to the Fire Stations. For the most part, you will be able to monitor most of what is necessary of the DISPATCH through simulcast. There are some situations (Bomb Threats, Hostage Situations, SWAT Team Standbys, etc> that we do NOT simulcast the dispatch.

As for Fireground activity, you can now (and will then) be able to hear our TACTICAL radio traffic in clear english on our fully repeated (non-digital/non-trunking) 800 MHz radio system.

The Los Angeles City Fire Department has never dispatched resources used the "Plectron-type" two tone sequential tones that are used by many

agencies. Even the LA County Fire Department abandoned its two-tone sequential tones (made famous on "Emergency") to adopt a system similar to ours.

We are impelementing an AVL and MDT system and will update the details on our WWW Home Page when the system is up and fully running. Our URl is:

http://www.ci.la.ca.us/department/LAFD/index.html

We look forward to your visit to Los Angeles. Happy Monitoring!

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

The 220XLT is a nice scanner. Lots of features. Good audio. Grat battery life. It's only real
problem is that since it is double conversion, it is prone to images. Usually not a big problem, but
if you live near an airport you'll get plane chatter in the 155MHz public service band.

I am surprised that he needed to wait 6 days on the ground before he could use his radio to contact anyone. I would think that his chances of survival would decrease drastically each day he was in enemy territory. I would hope that our government would provide pilots with a low probability of intercept (spread spectrum), secure radio that could be heard by military satellites as well as by friendly aircraft. I expect this is not the case. If it had been a secure, LPI radio, "Basher 52" would probably not have been challenged with "What was your old unit in Korea?"

It sounds like the USAF has not advanced past the days of the PRC-90 used in Vietnam. With these radios the downed pilot only could use AM modulation on 2 fixed UHF frequencies (243 and 282.8 MHz) easily received by North Vietnamese direction finding equipment.

You shouldn't have anymore than 5 to ten frequencies per net for trunked.
I've never heard of a twenty channel trunked net.
You may have more than one net programed. Check the frequency listing and
single out the individual frequency licenses by group.

Joe Balenzano (jpb@dart.thomsoft.com) wrote:

: Many of the 900Mhx cordless phone advertise that their phone's
: use Spread Spectrum technology.

: Questions :

: What is Spread Spectrum ?

Spread spectrum is a generic term which represents a wide range
of techniques for modulating a signal over an entire band. It is sort of
opposite of what most radios do now. The idea is to use as much bandwidth
as possible as opposed to conventional technology in which the least
bandwidth is used. Spread spectrum technology can range in
sophistication from simple analog frequency hopping (which most spread
spectrum cordless are), all the way up to fully public key encrypted
digital direct sequenced systems.

I should point out here, that while spread spectrum in many cases
does obfiscate the communications, it is not the purpose of it, and it is
simply a different modulation technique. I personally do not feel it is
a substitute for encryption for just this reason.

: If a phone is using Spread Spectrum, can someone still use a scanner
: to listen to a conversation like one can with the 46-49 Mhz phones ?

A scanner... Probably not a scanner alone, though if it were
imlemented poorly it is possible. If however, you had some slightly more
sophisticated equipment (possibly one of those "Communications
Interceptors" sold by Optoelectronics) you might be able to effectively
listen to the frequency hopping ones. As I mentioned, without
encryption, none of these technologies are secure. Period. The reason a
scanner doesn't work is because they aren't designed to listen to spread
spectrum signals, NOT because the spread spectrum device is hard to monitor.

Now, interestingly, theoretically a direct sequence (digital)
phone with a long enough (and re-randomizing) chip sequence would
effectively form a one time pad, which is the only unbreakable encryption
scheme ever devised. However, I am not aware of any phones which can
do that.

: If a 900Mhz phone does not employ Spread Specturm, is it a correct
: assumption that these 900Mhz phones can be scanned like 46/49 Mhz
: phones ?

Well, in theory just because a cordless phone is 46/49MHz doesn't
mean you can effectively listen in on it. The Motorola SecureClear

scrambles (albeit badly) the signal making it difficult to listen in without additional equipment. Such a technology or more sophisticated which are truly secure could be implemented on a 900 MHz phone without spread spectrum. Although, I don't know of any.

I personally would buy a direct sequence 900 MHz cordless. They are rather expensive, and only fairly secure (although probably the most secure you can get on any over the counter cordless phone), but they should give the best performance in terms of clarity, range, etc.

LC>Does anyone know how SJ Air One gets dispatched to it's
LC>various locations of need?

LC>Lee Carlton (speaking only for myself and not my employer)
LC>---

As, far as I observed (in my sit-along with SJ dispatch) they use whatever channel the event to which SJ 1 is dispatched to. They might use a specific channel to call it and let it know there's an event going but they use the same channel to communicate with the helicopter. If you find out some more please let me know, thanks.

Another route is to buy an expandable antennia, I purchased one from Radio Shck with a bnc connector for around $10 and it really pulls in the 46-49 MHZ. I had the same problem with range being limited to across the street with my little rubber knob that came with my portable scanner. For the price the improvement is unbelievable.

You may want to try a method that I use. I bought a Sony product used to connect portable CD players to car cassette decks. The device has a jack that plugs into the headphone jack o the CD player (in your case scanner) and the jack is connected to a cassette "tape." Just insert the cassette into the deck, and push play on your stereo, and it will play directly from your scanner headphone jack. It works very well. I think it costs around 15 or 20 dollars. It can be purchased at any stereo store.

I cut these from another list that I had, I think they should work for you. They are all used by storm trackers in the area. I normally listen to the Dallas freq. they seem to be the clearing house for all the storm info. If you have a MAPSCO map you should be able to determine the severe storm location down to the block almost.

4938. Seattle Freq's

Newsgroup: rec.radio.scanner
Date: 1995-06-13 00:00:00 UTC
From: msaran@olympus.net
Message-ID: <msaran-1306951937410001@ptpm002.olympus.net>
Source record: 254213

The two best sources are:

U.S. Scanner Pub's
1800-890-6999
Order the Washington book. I think that it has been updated recently. It is the best guide for the area since Mike McKenna put his books out in the late 70's.

Police Call
At almost any Radio Shack
Order the WA, OR and CA book (all in one). Lots of great info, not as easy to find as in the above one.

If you want to listen to Seattle you will have to get a guide as both the police and fire have gone to a new 800 mhz system. As you might expect the system has had many, many problems. I would have liked to hear the conversation between the Pres. of Motorola and the mayor of Sea. At that time the only fire was up on the system and it was going down one or two times a night. In fact Seattle Fire has put in an 800 simplex system for use at major fires. There is a receiver at each fire station and at each trunk site. Seattle police is in the process of switching over. I think that Capitol Hill is already over.

You can still listen to SPD on the old freq's (N 460.075 S 460.475 Dtown 460.175 Chill 460.125 Tac 460.25 and 460.425 MARS (central P.Sound common 460.55)

Seattle fire is only using one of the old freq's 453.8 for call out only.

Other funn stuff
KIRO radio 161.64
Traf. helo common 122.775
Airlift Nortwest
Medcom 463.1
Dispatch 155.295
Long range 129.825

Lots of great stuff out there. Email is you have any spacific ?'s Also let me know if you are into the hobby FAR enough to take part in meetings (every-so-often) of a group that has been meeting for over 20 years. We talk about some really wierd stuff having to do with local activities.

Joe,

Yes you can but you need to call Opto and obtain their interface that
converts the ver3.0 outputs to AOR format although I'm not sure if this
is available just yet. Your other alternative is to try and trade
in/exchange/swap/sell the one you have for a 3.1 version.

Source record: 254326

Scanner gurus:

Is there an internet resource available where I can find out who is using a given frequency (say 155.865 MHz) in a given location (say Dayton Ohio)? I am refurbishing a Motorola Mitrek radio and am receiving some stuff on that frequency but I have no idea what it is. The radio is going to be converted to ham frequencies before I transmit on it, but I'd like to get an idea as to how well its receiving whatever it is receiving now (ie, how far away this signal is coming from?)

It may be police or fire or something else. I dont know.

Thanks in advance for your assistance.

Brian,
I'm a little lost heer myself. As you know I listen to LAFD when
I'm back home. When you hear over the radio for instance "Task Force 88,
engine 83 Battalion ten to the structure bla bla bla," is that only a
snipit of what is going out over the staion radio at the same time or is
it a second voice dispatch done a few moments after the units are toned

out in quarters?

Also, are you guys similar to VCFD when rolling on EMS calls
where all you have to do is update your mst and not verbally reply on the
radio? And are some of your ems calls never sent out over the radio
'simocast' and everything is handled strictly with the digacom?

One other question that has puzzled me for years is that the LAFD
radio traffic, although on repeater, at least for me, only seems to come
in while in the LAFD area. Why is that? I can't get it say at Malibu
Canyon and 101 (sorry to all who have no clue what I'm talking about) but
when I get over the hill to Parkway Calabassas whammo, clear as day. Is
it just my scanner?

hey folkz. I am interested in buying a scanner. Probably the best reason I want it is as a toy <okok, so thats a bad reason. but I just thought it would be fun to have>. Anyway, I called a couple mailorder places out of Popular Communications and they told me the "one to get" is the SC150; one guy told me it already came able to pick up cellular <somehow i doubt that though.> I would like something easily modifyable and rather inexpensive. should also be able to pick up a wide range of cool freq's. Thanks so much if anyone has any suggestions. Oh, also, Im not looking to spend more then about $180ish and it should be handheld. Thanks! :)

4960. Freqs wanted: Lakes Superior and Huron shoreline in Canada

Message-ID: <john.ackermann.369.0010B95F@daytonOH.ncr.com>
Source record: 254034

Hi --

I'm going to be driving through the Georgian Bay area, and then around Lake Superior, in a couple of weeks. Specifically, we're driving from from Ohio to Port Huron, then up to Tobermory, by ferry to Manitoulin Island, then via the TransCanada Highway around to Duluth and back home via the Wisconsin and Michigan side of the lake to Sault Ste. Marie, MI.

I have a pretty good handle on the Wisconsin, Michigan, Minnesota, and US Coast Guard freqs that might be interesting, but what about on the Canadian side of the border?

Does the Canadian Coast Guard (correct name?) use the same working channels -- 21, 22A, 23, etc. -- as the USCG?

Are there any good general high band freqs to listen to for public safety services along the lakeshore (I don't have a VHF-Low receiver in the car)?

Thanks...

Hi,

You must have some old frequencies. Many CART teams operate in the clear. I hope your scanner receives 800mhz, because many of the best teams are up there.

Concerning the headphones, there is an outfit called "Racing Radios" that sets up a trailer outside many CART races. I saw them at New Hampshire in 1993 (I wasn't there in '94).

I have an extra set, used once, if you want to make an offer. I remember spending $65.00 the day I bought them, but I think that price included some mods Racing Radios was offering with them as a package.

Their other services include not only on-the-spot mods, but perfectly up-to-date frequency guides.

Enjoy!
Jim

Jeff,

You need to do two things......actually, kinda one.....

Call (800) RACE-FAN and tell them you want to subscribe to the monthly newsletter called Frequency Fan Club. ALL the frequencies you need for every race are not only in the newsletter, they also are available by phone, plus broadcast live on a UHF frequency at each race prior to the race. You won't go wrong being a member.

They also sell the headphones that allow you to hear your scanner at the racetrack over all the race noise.

Feel free to tell them I sent you.

GBI tends to use a lot of freqs in the VHF-hi area. I'll try to dig up some freqs and e-mail them to you if nobody posts them first.

Keep in mind that GBI is in the process of bringing online an 800 MHz statewide system...it may be a Motherola ASTRO.

> C> various locations of need?

This is from a friend that works for San Jose PD.

Air One uses a scanner and uses all the channels.
The only time they will transmit s if they are on or attached to a call. He said they usually get the call about 30 to 40 seconds before the patrol officer and will start transmitting/talking to the attached patrol unit after that. He said other wise they just listen in on the other channels and fly around. I hope that helps. He said to just keep listening to your scanner if you have one and you will hear them pop up every now and then unless its a really busy shift for them. They are usually up in the air for two hour intervals and then they land for about 45 minutes to an hour.

Source record: 254048

MSGID: 1:106/111 530b6260
Fellow Race Fans...

I am trying to find a recent issue of all the current
NASCAR frequencies for the upcoming Diehard 500 at
Talladega in late July. Does anyone know of a current
list out there, or maybe you could point me to an ftp site.

Last year, I got several lists of freqs from usenet
and also from a couple of ftp sites, but...

I put all those freqs in the scanner and when I got to
the track, 95% of them were scrambled. I guess the
race teams don't want the competition listening in.

Are there any drivers left who don't scramble their
signal?

Also, does anyone know any other freqs that would be
cool to listen to at the track... Alabama State Police,
EMS, track officials, safety crews, Television, etc, etc.
I am going to be at the track for three days, so some of
these might be cool to listen to.

Thanks everybody.

Thanks. I have heard some pilots announce the actual Uniform freqs before
changing, hopefully I'll catch them announce the Victor freq. The
Army has been using Low VHF (38.4, 40.9, FM) recently here in Maryland.

4977. Re: Help reading FCC data on 806

Newsgroup: rec.radio.scanner
Date: 1995-06-14 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <3rnaue$158@hopper.acm.org>
Source record: 254051

> ... they have a license for 806 mhz ...

"806.0000" is a placeholder in FCC records for the mobile units of a trunked system (rather than specifying each mobile frequency in the trunk for every user). The actual trunk license would be listed in the 851-869 range. For SMR (shared commercial trunk) systems, the license would be under the name of the operator of the trunk, not the various users. You'll find the same pattern with "896.0000" for trunks in the 935-940 range.

The FCC has stopped licensing end-users of SMRS trunks (except for certain special conditions), so most of the 806.000 and 896.000 entries will disappear as the licenses lapse.

Whether or not there's an 806 record, to find the trunk frequencies for an SMRS end-user, you'll have to find the business name of the system operator. Since a number of these licenses were grabbed by speculators, you may find Motorola operating a trunk composed of licenses to Joe Blow, Mary Green, and Dave Smith.

Bu> Joe,
Bu> 147.060 is in the 2mtr. ham band. NOAA doesn't transmit there, so
Bu> you must be getting a ham that shouldn't be digital/simplex at 147.060.
Bu> Ask around the amateur community for info on the "how to" and
Bu> the "how come?"

For the benefit of lurkers...147.0600 carries 300 baud ASCII data that is transmitted by WB9AGH here in the Chicago Metro area. The data is weather related and is transmitted for the benefit of radio amatuers involved in skywarn. Some of the info that is transmitted is weather forecasts, radar summary, watches and warnings.

It is possible to decode the data through an ASCII reader or a computer equipped with a modem.

Jerry

Nicholas McLarty (mcs@crl.com) wrote:
: D. Larson (dlarson@UWYO.EDU) wrote:
: : for this scanner that might let it function as a weather alert radio.
: Very simple. Construct a PL squelch/decoder unit for whatever the PL
: tone is that the NWS sends out for EBS bulletins. I think it's right
: around 1000 Hz or so. You could construct it to plug into to the
: earphone jack of your scanner, insert the PL squelch/decoder unit, then
: add on another speaker...all in a series, and that would only activate
: the speaker when the tone is transmitted. When you want normal operation
: again, just unplug your home-made toy.
This is something I've been interested in doing too, but it looks to me
that this approach would keep you from hearing anything that wasn't broad-
casting the NWS emergency signal, which is EVERYBODY ELSE. You'd might as
well leave your scanner locked onto NWS. Besides, if you were going to
have something dangling from your scanner (which is really annoying if
you're wearing a hand-held) you'd might as well have a separate unit.
I wrote to Bill Cheek (Commtronics Engineering...scanner mod guru) several
months ago with this idea. He said that it would be handy, but he didn't
have time to use on the research to develope something that was already
available at a reasonable price. It would be nice not to have to tote
around another unit just for the weather alert, but the manufacturers make
more money that way!

>code transmittals (try searching through a 32 bit address space when you
>have to wait 5 seconds between tries...)

Greetings. I say more power to them. True, some twerp might go through your toolbox because your garage is opened by 2KHz tone at 27MHz.. BUT, this stupidity is NOT going to change until the customers bitch and manufacturers listen. This is akin Satan (the network security "tester") and several system and password "testers" that are commonly available. If it weren't for THOSE, people on my system would still have stupid passwords like "green" and "unix".

People (aka designers/firms/etc) are as stupid as you let them be... It's CHEAPER! If Sears and others see that it's $15 for a "universal remote" (as Joel Kolstad put it) for garage openers exists and can be built by the average John Doe, Jr., something GOOD is bound to happen.

Of course, you can be a dumb as the Fed and just bury your head in the sand, like the fiasco with Cordless Phones. When the hell are these morons going to figure out that you can NOT legislate away "snooping". Of course, if the average Joe Blow and Jane Smance were smart enough to figure out what was going on and start bitching to the industry and government, we wouln't have these phones around! God, I was just "testing" and got BETTER reception on my scanner of the headset than my REAL headset.

[Sorry... This topic ticks me off in general]

Take care.

Whilst using a handheld scanner with a DC power lead, it seemed that if the scanner were not placed upon the table-top but rather upon an upturned glass, that reception was improved.

It may have just been the greater height, but would the insulating properties give rise to any explanation?

In my opinion for Handhelds that would be the AR8000 ($600). Or
BC3000XLT ($400). Also the Yupiteru 7100.

For Base units: Pro-2006 ($350 Used), BC9000XLT ($400 New), Pro-3035 ($400
New), AR3000A ($1000).

Frank,

>JoeWo@aol.com

Joe:

Since the Scouts v1-3 only output CI-V commands, you would need the Opto
ARCX cable ($35-$40). This translates the incoming CI-V command (from
the Scout) and output a AOR command (to the AR8k).

The ARCX cable has not been released yet. I'll let you know what the
status is in the next couple days.

A really top notch HF receiver covering up to 34mhz with computer interface
and DOS software for the low price of $750 is offered. Don't forget that
with the FM demodulator which is standard that it will do well on the low band
VHF as well (up to 34mhz). I get lots of skip in the morning till afternoon
from the Eastern seaboard. The software runs under DOS.

Buyer pays shipping.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can
listen to them. You can monitor the local sheriff and fire
departments to hear about events "as they happen," before
the news reporters hear about them. Hostage dramas, bank
robberies, car crashes, chemical spills, neighbor and
domestic disputes, tornado sightings are all fair game. In
a single afternoon, you can hear a high speed police chase,
Drug Enforcement agents on a sting operation, and
undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 and PRO-26 are good performers. All four models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high

frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains

detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It may disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their | operations with their assigned call letters either | automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall

security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an

outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available | from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association *

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, | about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business,

sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA |
P.O. Box 2681 |
Glenview, IL 60025 |

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15 - Winnetka
June 17 - Naperville EOC, Aurora Ave. |
August 19
October 14
December 16

Bring a notebook. |

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition
is expected soon and will be available from Grove
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military

installations, national parks, etc.

RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

RadioMap has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN. Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is also used to find sources intermod interference problems.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. Send $25.95 (check or money order payable to Bob Parnass) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel

(e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542

Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist

called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to

determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their

transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 110 scanners and monitor |
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other
radio hobbyists. This article describes a few of the FM
receivers in my collection, and is not meant to be
complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had
sellers look me square in the eye and tell me their radio
worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a
mobile or base model. Portable scanners are subject to
more physical abuse and many have been dropped. If a radio
has been dropped, the laws of probability dictate that the
first point of impact was probably a corner, so be sure to
examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration,
dust, and temperature extremes. This shouldn't dissuade
you from buying a used mobile scanner, but be aware of
possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner | World. Small, mobile scanner supplied with mounting | bracket and wall wart AC power supply. Some of the keys | are backlit. 100 channels in 5 banks. Service search. | Earlier version has Motorola type antenna jack and AA | battery backup. Later version has BNC antenna jack and | internal lithium battery. Can be fitted with optional | CTCSS decoder. Hyper sensitive and easily overloaded by | strong signals, especially when used with outdoor antenna | in base applications. Conventional 10.8 MHz IF prone to | images. Television audio heard in some places. |

BC800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC860XLT (Uniden): 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna.

BC9000XLT (Uniden): High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be | programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF | section, but not as robust as PRO-2004/5/6. One urban | user, located within a couple of blocks of several high | power transmitters, reports severe desense problems.

BC100XLT (Uniden): Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no

800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Also sold as BC205XLT through Scanner | World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): Excellent 400 channel portable with 20 | banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can | be locked out during search. Larger speaker than PRO-26 | produces better, crisper audio.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered

different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to

operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO-2035: Radio Shack's 1995 top of the line 1000 channel base scanner. Cumbersome 100 channel bank size. Tuning knob. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz first IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna.

PRO2037: Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, | respectable audio given the top mounted speaker.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High

synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack | portable with up conversion, and 222 MHz ham and 225 - 400 | MHz military air band coverage. 200 channels, single | search range. Small, convenient size. Muffled audio. | Speakers in early units known to fail and more powerful | speakers were used in later units. 800 MHz band coverage | fully restorable in early units by removing diode. Uses | same 6 cell battery tray as other high end GRE portables. | Subject to interference in 160 - 162 MHz range. |

PRO-60: Very good portable made by GRE. 200 channels, | single search range. Similar features and same IFs as the | PRO-43 it replaced but the PRO-60 has wider frequency | coverage and crisper audio. Covers 75 MHz and commercial | FM broadcast bands. Improved Direct search can be stepped | manually in single steps. Uses same 6 cell battery tray as | other high end GRE portables. Railfans take note -- the | PRO-60 and PRO-43 are subject to interference in 160 - 162 | MHz range. |

PRO-26: Very good portable made by for Radio Shack by | Uniden. 200 channels, very fast scan/search. Good | display. Covers all TV channels, but spectrum adjacent to | cellular phone band is censored which prevents monitoring | parts of some trunked systems (e.g., IL State Police | district 4). Up to 50 frequencies can be skipped during | search. Limited image rejection causes 929 MHz paging |

interference in 170 MHz range. Audio suffers from small |
speaker. |

PRO62: Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43.

PRO43: Good portable 200 channel scanner using up conversion. Covers military air band. Selectable AM/NFM modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6		X		no
FR2512	24	X			no
FR2513	24		X		no
FR2514	8	X		yes	no
FR2515	8		X	yes	no
FR2526	10	X		yes	yes
FR2526	10		X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers |

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

I am selling my 2006. Love it, but just don't have the time to play with
it.
I am the orginal owner, it is about 1.5 years old, and has been used
VERY little. In the past 6 months I have probably turned it on a dozen
times, if that.

I am asking $225. I have the original box, but may need to do some
searching for the original wimpy Radio Shack manual.

Please reply to evtme033@kgv1.bems.boeing.com.

I find that the Bearcat 200xlt works well when combined with a GOOD set of headphones, ie: David Clark. Have worked well at Indianapolis, Daytona, Charlotte and Michigan. Several companies advertise in racing publications packages with scanner, volumn modifications, long life batteries and headphones. They also sell subscriptions to frequencies used by teams and even have LIVE updates on the day of the race at the track.

You may also find scanner dealers at the tracks with team collectable trailers.

Good luck!

You migt try Uniden as (from memory) the SR-925 was based on, if not the
same radio as the BC-175XL ?

Little desk top, 16 channels ?

It is now illegal to listen to regular cordless phone frequencies... unless you are a party to or have permission from a party to the conversation.

The taped conversation should not be admissable in court and evidence gained based on the taped conversation would also be tainted. However, I have not yet seen that it has been tested in court since the laws changed.

You could be subject to prosecution. You could have been prior to the most recent law change, as well, as it was illegal to pass the info to a third party. I would guess your biggest legal 'threat' would be from civil suit brought for invasion of privacy.

Based on my experience monitoring Air One, they just fly around and monitor the frequency of
the area they are over while they scan the others. Dispatch knows which frequncey they are on
and calls them into another area if needed. Actually they seem to be self-dispatching - they
hear something that sound good and go there.

Yes! I have one, and I am extremely pleased with it (especially
since I received it as a replacement for a faulty AR1500).

Rather than describe it to you, I'll quote an e-mail I sent to
my brother (also a scanner enthusiast):

Last night, I picked up my nice, brand new, AOR AR2700. It is
pure joy to use! You can adjust absolutely everything, which
is really useful. Let me try to list the features I've discovered.

* Turn key beep on/off.
* Select "scan resume" delay (0.0 - 9.9 seconds)
- this is the length of time the scanner waits on a previously
active channel before resuming scan.
* Select "pause" (1-90 seconds, or "off")
- this forces the scanner to continue scanning after the
specified number of seconds, even if their is a continuous
signal present. It's like the "preview" mode of some CD players.
* Each channel stores the following info:
- Band (AM, FM, WFM)
- Step size (multiples of 5 and 6.25 kHz)
- Attenuation on/off (for strong/weak signals)
- Frequency (duh!)
* Any combination of the 10 banks (50 channels each) may be
selected for scanning (same as the Rad Shack machines).
* There are 10 search range memories, each containing
lo/hi freq info, band, and step size.
* Any combination of the 10 search ranges may be selected
for searching (similar to scanning multiple banks).
* One priority channel may be chosen. The "check" period may
be set to any number of seconds, I don't remember the range.
* Scan channels may be locked out.
* Any frequency may be added to a "lockout" list (50 freqs).
A frequency in this list will be skipped during a search,
so it's good for eliminating birdies or continuously noisy
frequencies. Actually, I haven't found any birdies yet on
this scanner, but I think all scanners have *some*.
* "Monitor" button opens squelch all the way for the current
channel (until you let go). Useful for signals which are
really close to squelch cutoff (they come and go).

* Nice green backlight for the large LCD display and also for
all the buttons. It stays on for 5 seconds after the last
keypress, but you can also turn it on "permanently".
* Excellent audio. Time to throw out my stereo! ;-)
* Sleep timer -- anywhere from 1-90 minutes (or off).
Because of the sleep timer, the scanner doesn't turn on
by turning the volume control. It has a PWR button that
you hold down for a second (provided the KEY LOCK switch
isn't flipped).
* Stupid feature -- if you power the unit on while holding
down a certain key, then, when you flip the KEY LOCK switch,
the keyboard becomes musical. Each key plays a different
note. The manual says you can use this at parties...

* Freq range: 500kHz - 1300 MHz
* Speed: 30 freqs/second
* Accessories: RS232 interface to computer (pretty expensive)
20 second voice record chip (don't know the price)
* Power: 4 AA NiCad (included) or Dry cell
AC Adapter included (also charges NiCads)
Cigarette lighter adapter included
* Antennae: Rubber ducky
Telescopic
* Other crap: Earphone
Carrying strap

Anyways, it seems to be very intelligently designed -- unlike
the AR1500 I had. The user interface is surprisingly good. Lots
of features and only 26 buttons/switches/knobs.

I took my recently purchased PRO-51 to the Miller Genuine Draft 200 indycar race at Milwaukee. I loaded up the frequencies that you have seen posted in this group. I was not impressed, there was VERY little to listen to.

The only interesting transmissions I could hear were from the CART official broadcast, and that happened only two or three times during the day. I did hear and recognize Bobby Rahal's voice several times during practice as he struggled mightily to get his car to work. Team Penske was scrambled contrary to what I have read here.

My next race will be New Hampshire. Where can I get the red headphones that everyone was using at Milwaukee?

FYI: The Uniden SportCat was the most popular radio at the event. Many of the racing teams were using banks of these to "spy" on the competition. Many scanners were being used without antennae or with a small, thumb-sized stub.

!!

THIS ONLY WORKS FOR OLDER PRO-51 SCANNERS. IF YOUR PRO-51 HAS A
DATECODE OF 8A4 OR NEWER IT WON'T WORK. CHANNEL 23 WILL BE LOADED
WITH AN 85X.XXX FREQUENCY.

5019. Police Codes

Newsgroup: rec.radio.scanner
Date: 1995-06-14 00:00:00 UTC
From: s_s@ix.netcom.com
Message-ID: <3rn6a4$40a@ixnews3.ix.netcom.com>

To all 8K users,
I would like to hear all the pros and cons from those who have put the 8000 through it's paces. I bought a new one that had a defective AM section and sent it back for exchange. The new one will arrive soon, and I need to form an opinion before deciding whether to keep it.
The first one would out perform my PRO-43 on VHF & UHF, but would not function properly on AM. That seemed to be the only fault I could find.
Thanks in advance to all that can help.....

Sounds like you have run across the band they will be operating in - not the
specific channels. There are 830 channels avaialable in the 806-821/851-866
MHz plan. The channels are assigned in pairs only. They can be licensed for
trunked or conventional systems.

You can't.
Cell phones that do this are integrated units, and they use the squelch on the cell phone to activate a switch to switch the radio's input from the normal radio front end to the cell phone.
I don't know of any way you can do that without some knowledge of radios in the first place. It COULD be done, though, in just that way... use the squelch to operate a solid-state switch, switching the inputs to the audio amplifier from radio to cell phone.

>I have been monitoring them for years.

We appreciate your continued interest in our agency and its endeavors.

>They are now on computer aided dispatch

The LAFD has been on a CAD (Computer Aided Dispatch) since June 26, 1973.

We will be moving from that continuosly improved system (described on our WWW Page), also known as FCCS I (Fire Command and Control Sytem 1) to our new FCCS II within the year.

>The dispatch knows where they are at all times.

Since 1973 we have beeen using (radio technology) Mobile Status Encoding Units, also known as "digicoms" on our apparatus to modify unit status and location. That has helped us kep down on the meaningless radio chatter and offer plenty of action to the monitoring enthusiast. Our FCCS II system, when fully operational, will utilize AVL and MDT's.

> For the most part they dispatch, both ways (I think)

Yes, if a unit shows "on the radio" (via their digicom), we will give them all of the details of their dispatch "on ther air". Otherwise, what you are hearing is a SIMULCAST (of what we wish to have heard), and not the full dispatch info that comes over the Fire Station Public Address system.

> I have yet to miss a call.

Once again, under normal conditions, you will hear @ 85% of our DISPATCHES and 100% of our TACTICAL repeated traffic on your scanner. We don't use "codes" and jargon is kept to an absolute minimum. We broadcast in a conventional (non-trunking) analog (non-digital) format. Because of this, even an out of town monitoring enthusiast can enjoy listening the moment they arrive.

I hope that I have been able to answer your questions.

Happy Monitoring!

What I have read on the equipment carried is that there are at least two spare batteries for the PRC112 in the vest or the survival kit - can't remember which. The batteries can reportedly last up to 7 hours depending on how they are used. I guess that means as a beacon, sending code, or phone.

If I didn't know how long I was going to be on the ground waiting for help in a hostile enviroment - I would likley use my battery power carefully also.

Yeah, I noticed it! :-(Here's an interesting story. I went down to the
NOOA office and asked why their forecast was on the police freqs. After
going to several people, nobody knew, and denied that it was possible.
Then, finally, someone remembered that the police told them that they were
going to rebroadcast it. Hmmmm...

Well, since that's our Federal Tax money at work, and now it was going on
our City tax money, I called the Mayors office. They didn't know anything
about it. They gave me the number for the police. I called the police.
They gave me the number for Dennis Quaid (sp?) who is in charge of the
radio system. After about 20 rings, I got his answering machine. I left
the question of why the weather was on the Police radio. The machine
said he returned all calls the same day. I didn't get a return call that
day. Or the next. However, the next day, and today, they aren't
broadcasting the NOOA stuff. Very strange.... I did get a call today,
and he told me a story about why they are doing it. It's because the
new radios in the vehicles don't have the capability to pick up the
weather....

I just got the July 1995 of Popular Communications and saw something interesting in the EEB ad. They do the mod to the AOR8000 that allows you to use the Scout to reaction tune the AOR. And they give a warranty for it.

When I called EDCO to ask about modifiying my AOR8000, they told me it totally voids the radio warrenty, and that they didn't do the mod either.

Their advice was to find somebody who would, and since EEB says they are a factory authroized AOR service, I guess I did. :-)

> Andy Dingley dingbat@codesmth.demon.co.uk

you are wrong, my friend, at least over here.
If you would look at the tv freqs, you would see that they range from the
low 50's up to over 800M.
A tv antenna makes a fine scanner beam.
And with a bit of trimmimg on the elements, it makes it even better.

I noticed that too. Is this legal? Did the local NOAA office consent to this?
It doesn't matter too much to me--I still listen to their old 460 MHz system.
The PPB frequency which I suspect will hog the trunked system will be net 8
(records).

Maybe the officers and fire fighters wanted weather information :-) :-) :-)

> Any help will be appreciated. Thanks.

Hi Pat,

A "Rule of Thumb" for VHF and UHF is:-

AM = VHF/UHF Aircraft (108-137MHz & 220-400MHz)
WFM = Broadcast Band Radio and TV Sound
NFM = Everybody else thats left

This is how some Tandy & Bearcat radios that do not have switchable
modes "think" - key a frequency in the airband and it will default to
AM, a Police frequency and it will go to NFM - whilst this is correct more
often than not you can sometimes find some users not in this anticipated
mode particulary here in the UK.

From: batwing211@aol.com
Message-ID: <3rpluf$qdf@newsbf02.news.aol.com>
Source record: 254066

I remember 155.505 and 155.805 or 155.815 (can't remember which) but I KNOW they use 155.505 in South Georgia!

These guys normally hang on the local GSP repeater and rarely use the radio. Units ID with GBI 101, etc.

Doug.

5048. How to open a Radio Shack Radio???

Newsgroup: rec.radio.scanner

Source record: 254071

dpfg@ukc.ac.uk (Duncan) writes:
: Whilst using a handheld scanner with a DC power lead, it seemed that
: if the scanner were not placed upon the table-top but rather upon an
: upturned glass, that reception was improved.
:
: It may have just been the greater height, but would the insulating
: properties give rise to any explanation?
:
:

This is stretching it, but perhaps when the scanner is elevated
on the glass, the DC lead now hangs vertically for several inches
between the socket on the scanner and the surface of the table.
Without the glass, the DC lead is horizontal. Perhaps the DC
lead is being somehow coupled to the receiver, and acting
as part of the antenna system. Most (but not all) UHF/VHF signals
are vertically polarized, thus reception might
improve if the DC lead, acting as a sort of antenna in addition
to the one on the radio, is now vertical.

It is also possible that the DC lead is coupled to ground thru
the transformer in the wall, and when horizontal, has an adverse
interaction with the reception pattern of the antenna. When the
scanner is elevated on the glass, the DC lead now is several more inches
lower than the bottom of the real antenna than it was before,
thus having less of an effect on reception.

Other than that, I don't think it has anything to do with
the glass itself. Does the scanner reception behave the same
on the glass WITHOUT the DC lead nearby?

You also might try just TAPING the DC lead plug NEAR the socket
on the scanner, but not plug it in, put the scanner back
on the glass, and see what the effect is. Also try it with the
DC lead plugged in, but pulled from the wall socket.

One more thing - is the glass resting on a metal table?
I'd say that would have an effect.

Mike

5054. My gripe about handheld scanners

Newsgroup: rec.radio.scanner
Date: 1995-06-15 00:00:00 UTC
From: hglassma@daniel.drew.edu
Message-ID: <1995Jun15.130125.122873@daniel>
Source record: 254073

I've been thinking of purchasing a new handheld scanner and I am annoyed because it seems like there is nothing special about the design of new handheld scanners.

If you look at those new cell phones they all look so sleek and futuristic yet the new scanners all look pretty much the same as they did five years ago.

And another think - why is it so difficult to make an alphanumeric display handheld? Yes the AR 8000 is out - but it has a lot of features that most listeners do not need and it is expensive!

So why are we trapped in the dark ages? Are there any things I have to look forward to in the next few months??

How low can your scanner go freq wise? SW stuff starts as low as 1 mhz, and goes all the way up to 25-30 mhz. If you can go that low, then hearing SW would be possible. But as far as I know, there aren't too many scanners out there that go that low, if any. Lowest I've seen them go is 25 mhz. But no one broadcasts SW radio programs higher than 25 mhz really. You can pick up CB's though.
I would just get a SW radio if you want to listen to SW stuff. You'd be better off that way.

Hi, Doug. Yep, you been down in Florida too long, the hot sun's
fading your memory of Georgians.

GBI is on 155.505 and 154.815 (30 kHz down from Kingsland MRD, remember?)

What "local GSP repeater"? Do they use something other than
the 154.68/80 and 154.905/935 half duplex ops (except for 155.91 in ATL)?

Still waiting for responses from my mail ;-)

Joe Balenzano (jpb@dart.thomsoft.com) wrote:

: Many of the 900Mhx cordless phone advertise that their phone's
: use Spread Spectrum technology.

: Questions :

: What is Spread Spectrum ?

Spread Spectrum is a modulation type that comes in two basic
flavors. The first is Direct Sequence, and the second in Frequncy Hopping.
A normal RF signal is taken before transmission and is spread across a
specified bandwidth or band regions.
DS does this by modulating the signal with a random number
generator. Each bit represents either a normal signal or an inverted signal.
If the random number generator is using a properly choosen primitive
polynomial, the energy is evenly spread over a bandwidth equal to the
frequency of the random number generation times the signal bandwitdh.
Many times this may make the signal actually reside below the local noise
floor.
To recover the signal, just remodulate the bandwidth by the same
stream of synchronized random numbers. The noise being random will keep
it's properties (energy level, distribution), but the signal strength
will be multiplied by the spreading factor. Other signals on top of this
one will look like noise, and will be reduced in despreading.
FH just changes frequencies at a given rate using a random number
generator. While it doesn't have all the nice properties of DS, it's cheap
and can actually work over non continous frequencies.
The chances of someone even detecting the SS signal, let alone
intercepting it is very low.

: If a phone is using Spread Spectrum, can someone still use a scanner
: to listen to a conversation like one can with the 46-49 Mhz phones ?

No, you would have to know the spreading sequence, and have a
synchronized despreader on the input to your scanner.

: If a 900Mhz phone does not employ Spread Specturm, is it a correct
: assumption that these 900Mhz phones can be scanned like 46/49 Mhz
: phones ?

If it's not digital, yes.

Don Hayes says:
" Contact Racing Electronics 1-800-272-7111 and ask about the assorted headsets
" they have for sale. You need a pair that will fit snugly over the ears to
" minimize background noise. Monitoring the races are fun !!!!!

I concur. However, you can use shooting "ear muffs" over your walkman ear buds. OR, if you have a pair of "ear muffs" that you like, you can install a pair of small flat 8 ohm speakers in them. The speakers are availalbe from JDR Microdevices in San Jose, Ca. (sorry, don't have the phone munber handy). I've installed both the 1 1/8" and the 2" and they both work well. The cost for the 1 1/8" x .157" thick is only $1.79 each.

-much cheaper than the commercially available noise supressors.

Another source of the commercial type is PELTOR Inc. (401) 438-4800 in Providence RI. For reference, the price of their head sets are $103.00 for either stereo or mono with the 3.5mm plug.

You can buy noise supressors from any shooters supply for under $30.00. Add the cost of the flat speakers and a curly cord and you've got the same thing (if not better) for under $40.00.

It isn't necessary to "mount" the speakers in the headsets. You *can* just place them under the foam and they work fine. I prefer to glue them in place with a dab of silicone. When you drill the hole for the cord also glue the cord in place and provide a strain relief with a small amount of silicone inside the ear muff.

Use tie wraps to secure the cable to the head band when you route the cable from one ear muff to the other.

hglassma@daniel.drew.edu says:
" I've been thinking of purchasing a new handheld scanner and I am
" annoyed because it seems like there is nothing special about the
" design of new handheld scanners.

One of the things I find frustrating is that many of the new models do
not use AA rechargable battaries. Most manufacturers have "discovered" that
by only providing for a single specific NI-CAD or Nickle-Metal hydride
they have us at their mercy.

I much prefer to be able to use rechargable AA. The difference in size is
less important that useful battery life between charges.

5069. Pro-37 top button woes

Newsgroup: rec.radio.scanner
Date: 1995-06-15 00:00:00 UTC
From: kws@fc.hp.com
Message-ID: <3rq79t$qqs@tadpole.fc.hp.com>
Source record: 254088

My pro-37 has two buttons on the top of the case marked SCAN and MANUAL that just do the same things that the corresponding buttons on the main keypad do.

I use these buttons a lot and now one of them is nearly dead; I have to press it at a certain angle to get it to fire.

Before I take the case apart to have a look, does anyone have any advice or experience with this?

-> > various locations of need?

Air One checks in on San Jose 1 (460.200) when they take off and jump between the different channels monitoring calls. They usually notify dispatch when they switch channels (going from district to district), unless it's a "hot" call. The also have a multi-channel/band radio on board and often come up on other agencies frequencies to assist on calls.

5074. >Nokia M-10 Cell Phone - Help<

Newsgroup: rec.radio.scanner
Date: 1995-06-15 00:00:00 UTC
From: shultz@bhnrc.usda.gov
Message-ID: <1995Jun15.094421.151@bhnrc.usda.gov>
Source record: 254093

I know this isn't directly related to scanning and scanners, but I picked up a Nokia Model M-10 cellular phone the other day and I need some information on how to do things like clear the stored numbers, the timers, and maybe things like setting the lock code (I figured out the one already in there -- last 4 digits of its number -- real secure, eh?). Anybody have the manual for this old guy? It looks like it's a couple of years old anyway. Any other neat things to do with this thing?

Thanks for any help or for pointing me in the right direction.

Thanks for the information, and the offer of a tour. I didn't mean to make it sound like I had definite plants to visit the LA area; the info on the WWW page just piqued my curiosity about how LA's system works. I will certainly keep it in mind, though, if I ever do visit LA in the future.

I'm sure it would be quite an interesting monitoring experience, as Phoenix's system is about half the size of LA's (44 Phoenix stations, plus about 20 stations from surrounding communities that share Phoenix's radio system).

I suppose I'll ask around and try to find out if Phoenix uses a similar system to broadcast audio to the fire stations. Too bad they don't have a WWW page! <- (Subtle hint to any lurkers from Phoenix Fire Dept)

Chuck

---

tom.miller@oho.com

I got a problem that I hope someone can help with. Here's what I'd like to get:
ahold of: 1. Any & all available modifications for a BC 210 XLT 40 ch. base
2. Any & all available modifications for a 200 ch. Realistic Base
3. Anyone who might be able to email me a copy of that amendment/law
I would also like to get ahold of a copy of the amendment/law that was recently signed to the ECPA that President Clinton signed into law making it
a crime to "intentionally" monitor cordless & cellular phone calls. The government will enforce this law when they start using screen door on submarines. Thanks again for your help. I'll owe you big time. Hope to hear
from anyone soon. Please email as my local BBS screws up & won't load up this forum at times. Why? I haven't a clue.
73's, Cheers,
Tom Miller

To the best of my knowledge in NYS it is not legal to have a scanner operating in the vehicle. If you are transporting the scanner and it is not wired to the car (including using the lighter outlet as a power source), it would be pretty hard to prove you were using it. I am not a lawyer, but it seems to me that if you get stopped and the scanner is on and the officer/trooper hears it, you would be asking for trouble. Sounds like a good case for common sense.
Also, NYS vehicle and traffic law mentions a permit for operation of the scanner, but I have never found out who issues such permits and it's been a running joke in several publications since no agency will acknowledge that they are authorized to do so.

Source record: 254112

I apologize for the late reply as I just saw your message. Anyway, here are a few useful tips.....

Buy a handheld portable unit that has rechargeable nicad batteries. The handheld is great cause you can take it anywhere. You dont want to get one that uses regular batteries because you will go broke constantly buying new ones. Buy one that has rechargeable nicads. Aviation band is from 110 to 140 MHz. The Maritime freqs are at about 156 to about 158 MHz. Military is in the 300 Mhz range and not all handhelds will pick that up. 2 Meter ham band runs at 144 to about 140 MHz. Shortwave will also be difficult. Conventional broadcast stations use about 450 456 MHz in the US. Good Luck, Radio Shack is a good place to go to select a unit.

CA>Does anyone know how SJ Air One gets dispatched to it's
CA>various locations of need?

CA>Lee Carlton (speaking only for myself and not my employer)
CA>---

there are no special frequencies. air one monitors the frequency of the district it's hovering over. it's not uncommon, however, for air one to just change frequency without notice. they just come up on whatever channel they are needed on. most of the events that the officers and helicopter (about 95% of them) are sent to the officers over the MDT's before the call is even verbally dispatched. this is why air one knows what channel to switch to before a call is even spoken over the air.

no, it's not your scanner. it's 800MHz. simulcast 800MHz systems like that, especially ones with several small low power repeaters throughout the coverage area instead of a few high power, high level ones will drop out like that in most cases. i have a dedicated 800MHz handheld (motorola, of course!), for monitoring medical services up here in santa clara county. you go over the hill to santa cruz, and two miles past the summit, it just drops, just like that.

greg

Whats funny is that Portland is having real difficulties with there
system. I've been monitoring the past couple days and have heard techs
T/S'ing and cops complaining. I have a few Portland Officers in my NG
unit and they're complaining that they sometimes have to wait up to 3
minutes to get in on the net. Short of hitting the panic button.

>Yeah, I noticed it! :-(Here's an interesting story. I went down to the
>NOOA office and asked why their forecast was on the police freqs. After
>going to several people, nobody knew, and denied that it was possible.
>Then, finally, someone remembered that the police told them that they were
>going to rebroadcast it. Hmmmm...

Just call the police department and tell them politely, "I believe that
'rebroadcasting' NOAA broadcasts on your trunked system is prohibited by
FCC rules."

If they don't believe you, refer them to part 90.415.

90.415 Prohibited Uses
Stations licensed under this part shall not:
(a) Transmit programming of any kind for use in connection with
broadcasting; or
(b) [stuff about prohibited common carrier services]

The NOAA weather BROADCASTS are programs intended for one way transmission
to the general public. They are not permitted on a private land mobile
system. Sometimes agencies forget that stuff or just don't think to check.

Keith:
If you are talking about RCSIs ScanWear....

Be VERY careful. I didn't post a statement as bold as yours, but what I did post on CIS (regarding installationg problems) has caused RCSI to file a slander lawsuit against me. This is what I heard through the grapevine and I haven't been served papers yet. RCSI has not contacted me directly either.

lubecke@tumbler-ridge.caltech.edu wrote:
>
>Why is it that aircraft frequencies always use AM modualion?
>I thought FM had better signal-to-noise capabilities.

If the aviation sevice was being established today it would likely be FM. But it was established, internationally, a long time ago (I don't remenber when) and FM was still pretty young and not widely implemented. There were bandwidth considerations also. Early FM was more bandwidth intensive than AM - Today they are comparable, in fact FM is becoming more bandwidth efficient than A3E.

Changing this standard would be a major effort. As a pilot, I would not want to deal with the cost, weight, and hassle of switching emission modes when I crossed a border. And getting every airplane in the world that has a radio(s) to change them is a pretty tall political order.

Many will tell you that it is to avoid FM capture if two stations talk at once. I don't believe that is a primary concern today. Under most conditions, you can still tell if two stations "double" in nFM operations. If two aircraft key up together on today's AM radios, the controller will likely only be able to copy one of them - if that. Usually all you hear is a squeal.

5108. Re: Interested in Sportcat sc150

Newsgroup: rec.radio.scanner
Date: 1995-06-16 00:00:00 UTC
From: Bill Herron <Bill.Herron@DaytonOH.attgis.com>
Message-ID: <DA8qw4.3DG@ranger.daytonoh.attgis.com>
Source record: 253931

I just recently picked up the SC150b and it seems like a good unit the
frequency range is very good about the only thing it dosen't have is the
military aircraft. I don't know about the claim Popular Communications said
but it picks up a fair amount of cell freqs (not that I would listen since
that is illegal). I would say there are in my area about 20-30 freqs I can
pick up on. The unit has I believe since I don't have it in front of me 12
banks broke up into faily managable freq range with a touch of a button or two
you can scan for new freqs. The only drawback to the machine I can see is that
you cannot set up search limits to scan say for instance 125.0000 to 132.0000
you have to go to that bank and start either at the high or low side of the
band. I would recommend the unit to anyone.
~==========Andrew Sitzer - Point Blank BBS, 6/14/95==========
~
~hey folkz. I am interested in buying a scanner. Probably the best reason
~I want it is as a toy <okok, so thats a bad reason. but I just thought it
~would be fun to have>. Anyway, I called a couple mailorder places out of
~Popular Communications and they told me the "one to get" is the SC150;
~one guy told me it already came able to pick up cellular <somehow i doubt
~that though.> I would like something easily modifyable and rather
~inexpensive. should also be able to pick up a wide range of cool freq's.
~Thanks so much if anyone has any suggestions. Oh, also, Im not looking
~to spend more then about $180ish and it should be handheld. Thanks! :)

I wish to sell my HX1500 scanner complete with owners manual. In A1 working condition. Has complete search capability, can hold 55 channels, has 4 programable banks to hold pre-selected channels for quick access of specifically stored channels such as aircraft, marine, police, etc. Has lock-out, delay, priority and hold features. Ni-cads with charger and carrying case included. Want $100 which will include shipping and handling.

E-mail me if interested.

Jeff.

Can anyone in the East Bay of the SF Bay Area furnish the CHP freqs that the cars use?? I want those freqs specifically in and around the Hayward, Fremont, Oakland, or San Jose areas. I can get the base transmissions, but get nothing on those listed as car to car or car to base. Can anyone help point me in the right direction to get both sides of their conversations??? Thanks

Jeff

5111. BC760XLT Lithium Battery Discharge Problem

Newsgroup: rec.radio.scanner
Date: 1995-06-16 00:00:00 UTC
From: rmarkl@supernet.ab.ca
Message-ID: <3rr3ji$k45@tibalt.supernet.ab.ca>

RE: BC760XLT Lithium Battery Discharge Problems

I'm curious to know if anyone else has experienced a similar problem with the BC760XLT or if anyone (hopefully) can help me out with a fix to this problem.

When I first purchased my BC760XLT (a few years ago) the internal lithium battery lasted about one month and then died. I returned the scanner to the dealer and they replaced the lithium battery. I subsequently returned the scanner two more times to the dealer - each time the battery lasted about one month and then died. I eventually gave up and resolved to live with the problem (keep it plugged in and no problem - though can be quite annoying if you move the radio or in the event of a power failure.)

The dealer indicated that they had came across a few BC760XLTs with the same problem - obviously though, the recommended repair didn't work so well!

I've taken to plugging a 9V battery into the power jack when I move the scanner - if I can do it before the capacitors discharge! I'm looking for a more eloquent solution.

I've checked the various FTP sites for mods to fix this problem but have came up empty handed.

If you can offer assistance please e-mail or post to group.

Thanks...

PS. BC760XLT is a great scanner - just watch out for the lithium battery!

In regards to the downed pilot what got to me was the fact that every news agency in the world was talking about his locator radio. If I were trying to knock out airplanes and heard that there was a locator radio, even from the evening news, I would have all of my troops out monitoring that freq. Gad, we sure tried every way to get the poor guy caught. I guess captured pilots make better or longer lasting news than retrieved pilots. I don't know who it was that told the world about his radio before he was rescued, but I wouldn't call them friends.

The antenna you want is in Puerto Rico. It is called Aerocebo, it is a movable feed dish antenna built into a natural valley. It shouldn't cost you more than $30 to $40 million to buy it and move there. You asked for it and you got it. The best antenna in the world.

Don't you know? The next scanner out is the best. If you want an all around, reasonable priced, modifiable one get an older Pro 2006. Computer interface and all available. That is probably a good feature to have so you can do automatic logging, download frequecies easily, etc.

I have found Monitoring Times to be an excellent magazine. I have subscribed to many ham magazines over the years and I find for the listener or neophyte interested in electronic or even the old timer their articles are well written, ususally tested, and easy to understand. They cover the whole spectrum from DC to light. I have recommended them for many people. (Maybe I need to call and see about a free sub. to Satellite Times their new mag.) Their address is Grove Enterprises, P.O. Box 98, Brasstown, NC 28902-0098

They also have a landline BBS that has scanner mods, etc. ONLY AFTER WORK HOURS. (704)837-9200 after 5:30 PM to 8 AM weekdays and all weekends.

Try it you'll like it.

Tim Bohr asks about the Grove Shortwave converter for $99.

I had an earlier version of this that cost around $40. It was nothing but a simple unmounted circuit that you plugged your COAX cable into. It did convert SW signals to the aircraft band, but you had to use a chart for the conversion. Unless you used math to figure out the conversion relationship, it was pretty near impossible to program a specific SW freq.

Overall, the thing did work. I picked up most of the major SW broadcasters, and using a good search could identify other signals. I used a simple short inside wire as an antenna. For $40 it wasn't a bad deal, but I imagine that all you get extra for $99 is a case and an on/off switch (mine you had to disconnect the battery from when you wanted to turn it off). For that kind of money, you're much better off getting a used SW portable from Sony or Sangean, IMHO.

Hope this helps.

Just a thought, RF (X & Ka band) Zappers are easy to get. Even "Real" surplus speed radars are not that hard to get.(and have a much longer range than the small "Zappers") Does anyone have any thoughts on a laser style "zapper". It seems that it ought to be easy to design and build one using either IR leds or IR lasers ought to work fine. I have noticed that some electronic ballested lights set of the laser dectectors.

While I realize that this is not strickly related to SCANNING, since others have shown their interest in "zappers" it seemed to be a good as place as any to post.]

BTW don't knock "zapping". It isn't allways done to be "mean", about 100 miles north(death HILL) or 150 miles south(Jelico mt) the 18 wheelers will run you down. A "zapper" keeps them off your rump. Might smoke their brakes but they will stay off your rear if you "zap" um.

A low estimate, I think. Maybe a couple hundred million. It cost
$9 million to build in 1963, and has been upgraded since.

>
>You asked for it and you got it. The best antenna in the world.
>

He didn't ask for the best antenna in the world. He asked for the
best _scanner_ antenna in the world.

Dish antennae are inherently poorly suited to scanning because of
their very narrow angular beam.

Arecibo is even worse, thought, because it can only be pointed in
a small region around the zenith, while most interesting scanning
signals come from the horizon.

Hmm...this would be an interesting thing for them to try to prove. In order to prove slander successfully, RCSI would have to (I think) prove that the statements you made were both malicious and untrue. Assuming that the statements made are true (and if it is true that this software cannot delay after a carrier drop, then Keith's statement is true), slander is not provable; in fact, arguing that the statements made were true is an affrimative defense against slander, since slander only applies to malicious, _false_ statements. Also, technically speaking, malicious false written statements would be libel, not slander.

> on the subject to better understand how it works.

Hi Bob,

DES was DESIGNED to be difficult to decode without a key (it's the approved method of encryption for wire transfers between banks), and as it turns out it's pretty messy to decode even WITH a key. You can read all about DES in the official government standard that defines it, FIPS Pub. 46, "Data Encryption Standard", published January 15, 1977 by the Dept. of Commerce. It's also written up in most current books on cryptography, such as "Applied Cryptography" by Bruce Schneier (an excellent all-round book), or "Cryptography and Data Security" by Dorothy Denning.

Hope that helps,
-Patrick Penzias Dirks.

This is a little disingenuous. The Bosnian military is certainly
sophisticated to know about survival radios. You write as if they're
a bunch of ignorant hicks who have no idea about how the world works.
I'll bet one of our Blackbirds that the ground troups knew a) that
O'Grady had a radio, b) what the frequency is, and c) when and how he
was likely to use it.

You can't give away common knowledge. Maybe it was a revelation to
you that pilots carry locator radios, but it's common knowledge to
the military community. Trust me on this.

In an dutch magazin i read aboute The worlwide Aeronautical Communication frequentie directory.

I will buy this book, but i don't know who's the auteur and what's de ISBN number.

Is there someone knows the name of the acteur and the ISBN number of this book.

In the bookshop i have ask, but they can tell me.

Bye !!!

```
* In a message originally to LUBECKE@TUMBLER-RIDGE.CAL

L>Why is it that aircraft frequencies always use AM modualion?
L>I thought FM had better signal-to-noise capabilities.

Doppler shift!

Frequency modulation will compress and decompress relative to the
direction and speed of the aircraft making voice recognition
troublesome while amplitude modulation won't be affected by speed
although it's carrier freq will vary.

Doppler shift can become a big problem as you reach super sonic speeds.

Af> zone. I'm looking for people with previous experience with monetering
Af> the security of the G-7 who would share frequencies, etc.

Try the standard RCMP 420 Mhz frequencies. During the 1987 G-7 conference
in Toronto, that's where they were. During that event the system was not
operated in trunk mode, and there were very many frequencies in use
at one time.

If you'll pardon me a reminiscence, that particular event was
the *best* scanning experience I ever had.
At times there were up to 7 motorcades operating at the same time, as the
various leaders were moved between events. The traffic on one frequency,
which apparently was assigned to plainclothes 'watchers' in crowds, was
really fascinating. They sure have a lot of information in those files!

Radio discipline was incredibly tight. There was heavy use of codes, and
incredibly calm radio procedure. The only slip-up I heard was someone who
referred to their motorcade's principal passenger as 'she' - which led
to the inference that it was Margaret Thatcher's convoy - the comment was
immediately and sternly reprimanded over the air.

Good listening
Paul

It depends where you live. A high gain antenna will cause problems in high signal areas. If you want
a gain antenna the Create Log Periodic would be hard to beat (unless you want to mount a yagi for
each band you are interested in.) The main problem with wideband gain antennas like the log periodic, is that you gat gain on the pager frequencis also which might flood the front end of your
scanner. If you don't want a gain antenna, then the Scantenna (has about six elements and looks like
a big spider) or the Diamond discone would be good choices. Another antenna to consider is the
Diamond D707 Super Voice. It has a built in 20db amp. I've used one for several years with my
R7000 and it seems to do a good job (but when the power goes out it doesn't work too well).

Really? I've seen quite a few. They're quite popular in Canada and most
dealers stock them.

> I doubt it if any one at a ham flea market would sell one at <$300.- much less
> 100 as was listed for th unit in ??

We were buying GP300's last year at Dayton for $150. Other vendors were
selling them for anywhere from $150->$300.

The GP300 will cover the ham band if you get the right split.

Locator radios feature prominently in a great many works of fiction
and films: the novel "Flight of the Intruder" has a very good sequence
depicting the rescue of a shot-down pilot. It's hardly a secret.

Now at least nobody posted the frequency... :-) But everyone with any
interest in the matter at all could have guessed O'Grady would have had
a survival radio. He knew they would know, which is why he stayed off the
air so much.

After talking to B. Cheek, he advised that 16 Mhz was the fastest speed
that had no reported lockups. I had previously tried 24 and 20 Mhz without
success. 16 Mhz has been running trouble free for over a year without
skipping any weak signals (compared to my other unmodified 2006).

I operate my two way radio business one and one half mile south from
the fire tower (11021 Hamilton Avenue about 12 miles north northwest of Cincinnati
ati, Ohio)

The Comm Center "KQI-316" tower seems to be about 300 feet or so. The input is
33.580 which would be a rare catch from your distance.

The frequecy 33.90, 33.580 and fire grounds 33.66, 33.84 and 33.96 are the only
vhf low band the county has left (except 30.880 SPCA).

Believe it or not they don't use CTCSS or DCS.

I can bring up the machine with my service monitor with an outside discone.

Positive - Look quite smart - less conspicous (sp?) than some Mag mounts

Negative - In my experience not so good when it comes down to
operations. You loose a fair bit through the "glass"
although if you are using it close to the transmission you
should be OK. I have one on at the moment that works OK when
I'm at an airfield listening to the local traffic but
anything more than in the immediate area and the performance
fades off. Depends how happy you are trading off performance
against "looks" IMO

Sent it to Uniden Monday, June 5, got it back today, June 16. Not bad. They fixed the lockout bug (it would not lockout the preprogrammed freq's, which just KILLS you with pager intermod when you can't lock it out). The only bad thing I have noticed is that you can only lock out 50 pre-programmed freqs, after which it starts turning freqs back on. Problem is, in NYC area, this makes the "police" band almost unusable, as you can't lock out all the NYC freqs, and there are really too many to try and monitor. It does have a "private" band, where you can add 25 freqs, and disregard everything else. On the highway, when traveling, this is not really a problem, as you soon out run noisy freqs, and just have to "lockout" selectively as you move from area to area. Used it on the local highway today, and it really works well now. Was not bothered by intermod at all . Still too many busy freqs around here, however, so generally using it as only a 10 channel scanner.

From: dbaker@tiger.lsu.edu
Message-ID: <3rtivm$1mg@tiger1.ocs.lsu.edu>
Source record: 253984

I just heard on the news tonight that there will be some sort of
joint training excercises in August at Fort Polk, here in Louisiana.
All I caught (I was in the next room at the time) was the date and
that it would be U.S., Russian, British, and French troops, but
if they gave specifics, I missed them. I am going to call the
tv station I saw it on and ask them what they know, but I wanted
to post this now for two reasons: first, to ask if anyone out there
can tell me which units from which country will be participating,
and secondly, WHAT FREQUENCIES TO MONITOR. I'll try to post any
information as I get it, but I figured this type of thing is pretty
commonplace and some of you guys have monitored excercises often
enough to give me some pointers.
Thanks
Dave

>my scanner (a yupiteru) do the trick?

There are a few scanners that feature coverage into the shortwave
range. The Yupiteur MVT-7100 and the ICOM R1 (I think) and
the AOR AR-1000, AR-1500 and AR-8000 all do this. There also some
Trident and Cannis radios that have this coverage.
I own the Yupi 7100, and have friends with the other AR radios.
The 1000 is a pretty good radio, but universally considered hard to use.
The 1500 is the 1000 with single side band coverage.
The 8000 is the most full featured of the radios, with a computer
interface, alpha-numeric display and lots of other bells and whistles, but
it is generally considered not quite as good a "pure radio" as the Yupi.
The performance differential is most acute on the shortwave bands.
The MVT-7100 does a very good job on shortwave (as well as, of course,
the UHF/VHF frequencies). I have a SONY 2010, and the Yupi is NOT as good
on shortwave as the SONY, but I'd say it's level of performance is
approximately similar to the DX-440/ATS-803A. The SONY's sync detector is
a BIG advantage that no scanner/SW radio has (but neither does the DX-440 or
even the new Yacht Boy YB-400).
It's AM filter is a bit wide for the shortwave bands which can cause
adjacent channel interference to be a bit worse than it should be, but it's
sensitivity, either with its standard antenna or a $9.95 Radio Shack
"loaded coil" antenna is very good. I have clipped a 20 foot or so length
of wire onto the antenna, and under some conditions it can help, but it
is not required.
As someone else said, if you're mainly interested in shortwave listening,
a SW only radio is a more cost effective choice (I like the SONY 7600G and
my 2010), but the Yupi does a good job of being an all-in-one receiver.

>Try it you'll like it.

The BBS has 3 numbers, available from 5pm-8am EST, M-F and 24
hours/day on weekends. The numbers are:
1-704-837-9200
1-704-837-5183
1-704-837-7081

The BBS is free (except for the long-distance charges, of course). It
is dedicated to shortwave/scanner folks and has mods, freqs, etc. as
well as the typical games/sounds/graphics. Worth a call just to see
it!

Thanks.

I don't have the files at hand right now (and they are VERY large), but
I got a lot of good freqs from The Frequency Forum BBS in Virgina
(703) 207-9622.
Actually you don't need a scanner... it'll never leave whichever
dispatch frequency it hits first anyway :-). Monitoring police comms
in D.C. is both funny and sad.
A couple of dispatcher quotes from a recent visit:
"It must not be bad... only four shots were fired."

"A burgulary? Well they'll just have to wait in line."

No, no, no... don't wanna live there.

5166. Picking up Cellular on 902.0 - 915.0 ?

Newsgroup: rec.radio.scanner
Date: 1995-06-16 00:00:00 UTC
From: critchie@ix.netcom.com
Message-ID: <3rqiu1$kg1@ixnews3.ix.netcom.com>
Source record: 254125

I'm using a recently manufactured model of the Uniden BC200XLT and when looking at the current mods for this unit, I found that the internals are different than described in mod 1 and mod 2. I heard a rumor that a new mod is available in the new book 'The Ultimate Scanner'. Can anyone confirm this?

In one of the mods, it says that no hardware modifications are necessary for cellular if you add 21.7Mhz to the cellular frequency and manually enter it. I've found that I am picking up cellular between the 902.0-915.0 frequencies. I was wondering if this is specific to the BC200XLT or if my local cell sites are transmitting on these frequencies.

Determining this will aid me in deciding whether or not to perform the new modification once I find it.

Thanks

critchie@ix.netcom.com

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483. Uniden currently charges |
a flat rate of $54 for scanner repairs. They will repair |
and return "out of warranty" items without an estimate |
unless the repair charges exceed the flat rate charges. |
The phone number for repair is (800)297-1023.

G & G Communications (telephone (716)768-8151) is a family | owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the

squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally

mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the

"down" position. Scraping the circuit board between the
two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics
in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Correct - at these speeds and frequecies, Doppler shift doesn't exist, for practical purposes. BTW - In applications where Doppler is an issue, it will affect AM.

I just received my Scan*Star software for use with an optoelectronics equipped RS 2006. Has anyone used this combination of software & hardware before?

I'm having serious problems, and can't get any support from Signal Intelligence, the makers of Scan*Star. Their e-mail address returns the messages, and their Mustang BBS is set up in a way that either makes it impossible or at least very difficult to leave messages.

Here are my problems:

1) the cloek on the Commercial version won't stay set properly. It looses 3 hours when the screen is changed, or the program is re-started.

2) can't figure a decent way to change the reception mode from the set defaults. The documentation tells how to change the default, but i just want to occassionally change from the default. It can be done by using BOTH the CTL key and the ALT key; I discovered this after hours of screwing around with the program - it's not documented.

3) I must just be missing the point here... I've read all the documentation, and it is just not clear how to scan anything other than a single huge group of frequencies. If I make a scan group (only way other than a search range) of 10 banks of 40 freq's each, how can i set it to scan just banks 2, 5, & 6? Do I have to COPY these banks into another scan group and name it? (GEE, that's a LOT easier than pressing three buttons on the face of the scanner!). There just has to be something i'm missing here, and hope someone can clear this up for me. Any input would be greatly appreciated, as I truly want this to work for me.

I'd appreciate e-mail response instead of just a post.

Thanks much.

Jim Brown

5185. Pager noise on PRO-2021

Newsgroup: rec.radio.scanner
Date: 1995-06-17 00:00:00 UTC
From: ah254@freenet.toronto.on.ca
Message-ID: <DABupJ.2yB.0.queen@torfree.net>
Source record: 254004

I have an old PRO-2021 (no mods have been done to it)
It gets swamped by blasted page and in some cases ham noise; signals that
bleed in and distort the fire/ambulance bands (150-154MHz area) mainly.
The only way I can scan them is turn the squelch all the way up and
shortent the ant. down to 1.5 sections.

Is there and filter that could help out here?

thanks

5191. Re: ?Why AM for aircraft?

Newsgroup: rec.radio.scanner
Date: 1995-06-17 00:00:00 UTC
From: Dick Dillman <ddillman@igc.apc.org>
Message-ID: <APC&1'0'7cbf1eb0'00f@igc.apc.org>
Source record: 254010

Jim's invocation of Doppler shift as the reason aircraft use AM is unique but not the actual reason. Even if Doppler shift were a factor, it would of course effect AM and FM modualted signals equally.

The real reasons aircraft use AM are that FM receivers have a capture effect that allows a stronger signal to completely block out a weaker signal underneath. Not what you want in an emergency situation. Also, two AM signals on the same channel will produce a heterodyne squeal that is much more distinct than when using FM. Again, this announces the presence of a second, and possibly emergency, transmission on the channel, although I admit that some unicom channels sound like CB channels these days. A possible third might be the simplicity of detection circuitry for AM as compared to FM. This might have had a power and weight advantage when VHF was first introduced to aircraft communications.

Regards,

Dick Dillman

>snipit of what is going out over the staion radio at the same time or is

>it a second voice dispatch done a few moments after the units are toned

>out in quarters?

Ken, as to the DISPATCH of units "in quarters", all you hear is a "snipit". There is only -one- voice dispatch. Under normal circumstances, this dispatch is conducted over a secure and redundant data line to the Fire Station Public Address System(s). A brief portion of this dispatch is commonly (but not always!) simulcast on the radio as a courtesy to those on the air or monitoring. It usually only includes the call type and address. This simulcast is the part you hear on your scanner. Often the dispatch info that is piped into the Station's PA system is in greater detail or includes info that we would much rather not (or need to) make public. Caution advisories or other pertinent details are included in both this long ("PA") version of the dispatch as well as on the MDT and hardcopy that is printed on the InkJet printer on the Fire Station apparatus floor. If assigned units are "on the air", they currently receive a full verbal dispatch as well as an MDT update and a hardcopy that will await them when they return to quarters.
>Also, are you guys similar to VCFD when rolling on EMS calls
>where all you have to do is update your mst and not verbally reply on
the
>radio?

Our use of Mobile Status Encoding Units ("Digicoms")dates back to 1973. We were pioneers in utilizing that technology. (Lotsa hard lessons in those days <grin>.) All common info such as "Enroute", "On Scene", "Available", etc , as well as our location as it relates to Fire Station District has been sent electronically for 22 years. Yes, 22 years!! The Ventura County Fire Department (a fine agency) is a rather new user of MSE equipment.

We still understand the importance of a broadcast verbal size-up and non-encrypted TACTICAL radio traffic though.

Heaven help the person who would try to monitor the LAFD if we had all of the chatter that Digicoms help us avoid. Remember, we do more than 800 calls a day.

> And are some of your ems calls never sent out over the radio
>'simocast' and everything is handled strictly with the digacom?

Again, most calls are simulcast (EMS or Fire) but some are not. There are a variety of reasons for that.

FYI, simulcasts of dispatches as we know them will end when FCCS II is fully implemented. I'll cover that issue in a few months.... It requires a lot of explaining!
>One other question that has puzzled me for years is that the LAFD
>radio traffic, although on repeater, at least for me, only seems to come

>in while in the LAFD area. Why is that? I can't get it say at Malibu
>Canyon and 101 (sorry to all who have no clue what I'm talking about) but
>when I get over the hill to Parkway Calabassas whammo, clear as day. Is

>it just my scanner?

We have nine transceiver sites. The foothills beyond Calabasas do have some shadowing. If we operate in that area (well outside our jurisdiction) we can patch our radios with LACoFD or with the State OES Mutual Aid frequencies. If operations in that area are extended, we can use a portable mobile repeater. It would cost us several million dollars to put up an additional radio site in that area. The benefit to the taxpayer (or to our Department would be zip. I should note though that our radios do work throughout the City of Los Angeles. They offer excelllent penetration. The general area of our 800 Mhz coverage (coastally) is essentially from Dana
Point on the south to just north of the City of Ventura.

I hope this answers your questions.

Thanks for your continued interest in the Los Angeles City Fire Department

I took the rabbit ears that came with my tv since I don't use them and
got an adaptor (actually two adaptors, 300 ohm to 75 ohm, and
f-connector to BNC) from Rat-shack, the improvement in the 46-49 was
great and there is also a bit of directional-ability as well so you
can kind get an idea from whence the transmission originates by
rotating the rabbit ears.

Message-ID: <000005390000110F@prostar.com>
Source record: 254026

Dave was heard to whisper across the Electronic Void:

D<>I recently tried hooking up my TV cable to my Pro-46 with a RF to BNC
D<>converter. I couldn't get any reception. Could anyone please tell me why
D<>this doesn't work? Shouldn't I be able to get great reception at _some_ freq

I may be wrong, but isn't most TV cable coax? If it's coax it's
shielded, and if it's shielded you won't get any reception...
a plain wire would be better - just make sure it's the correct
length for the freq(s) you want.

* OLX 2.1 TD * Television is the opium of the masses.

>
Yes it would affect both Am & FM equally but it doesnt really matter if the frequency shifts on AM reception
as the audio is carried on the amplitude.

Also doesnt AM carry much further than FM, the signal strength to distance ratio is a gental slope as where FM
the signal will drop off very quickly at a given point, Like NICAD batteries to give an example.

This message is to everybody in Sweden monitoring this newsgroup. (And everybody else of course....)

I'm looking for the freqs that will be in use during the World Championship in Athletics in G�teborg August 4-13, the radios will be some kind of generic Motorola, probably in the VHF range to judge by the antenna.

All ideas and comments will be appreciated.

Sincerely yours

Anders Liljeberg

I am a novice RF monitor. I have a Pro 51 with a Radio Shack scanner roof mount antenna mounted in the attic. I would like to be able to resolve 46-49 MHz signals I can hear in this frequency range that are now primarily static. (They may be cordless phones and of course I would not be able to listen to these.)

Would a better antenna help? Would a better receiver help?

Can anyone give me advice on voice activated portable cassette recorders. Regular size cassettes vs. micro cassettes? Would the Radio Shack USC-2001 be good or can I buy less quality.

Thank you.

I have one, and it works all right...however, for the money (about $30 at
Radio Shack) the magnetic mount that they sell seems to have better
reception than my glass mount. If you live in a metro area, the glass mount
should work pretty well for you. Happy listening!

Cross-posted to: in.ham-radio,alt.radio.scanner,rec.radio.scanner

I am an EMT in Northwest Indiana. I am interested in using a scanning radio in my vehicle to monitor a few frequencies in the area that I cover.

I have been told that the use of a scanning radio in a vehicle that is capable of receiving police frequencies is prohibited in the state of Indiana. Can someone please confirm this?

I have also been told that it is possible to obtain some sort of an amateur radio operator's license which would allow the use of a scanner in a vehicle. Does anyone know if there is any truth to this? I have tried contacting local authorities, but they of course deny any such license or privilege.

I have been told to simply carry my portable radio from my ambulance service which only has our main ambulance frequency on it. The problem is, that isn't the only frequency that we monitor while on duty.

I work for a large private ambulance service which serves 4-5 towns/cities exclusively and backs up about 8 other cities. There are police and fire frequencies for each city/town that we cover as well as our own frequencies and various frequencies for communicating with the local hospitals.

I would like to be able to listen in on all these different frequencies while in my vehicle. I am often in one of our covered towns/cities when a serious call comes through. I am able to respond from my vehicle if additional assistance is asked for. I do this now, but I would like to make it legal so as to avoid any potential trouble in the future.

I have just started looking into the use of ham radio. I really don't know much of anything about it, but I have been told that it can also act as a scanner. Would someone please be kind enough to enlighten me on the rules, available certifications, and any suggestions that you might have?

Thank you! :^)

Hi!

I am an amateur Radio Operator in the state of Indiana & we are exempt
from the state law concerning mobile use of scanners.

If you want the exact wording of the law, refer to to the:

Senate Enrolled Act No. 325
Second Regular Session 108th General Assembly (1994)
Section 1. IC 35-44-3-12 (effective July 1, 1994)

Since "Hams" help with the reporting of severe weather in the state, many
of us have scanners in the car.

Your best bet is to carry a copy of your state's law in the car with
you..JUST IN CASE!!

But to answer your question..You must have a valid Ham radio license to
use a scanner in a car in Indiana (and most states in the US)..

This is what I do when in Inidana too. It's one of the
reasons I got my tech license (note item 6):
==========

The following is a section of Indiana Criminal Law and Procedure that
pertains to scanners:

35-44-3-12 Unlawful use of a police radio; exemptions; portable police
radio defined
Sec.12. (a) A person who knowingly or intentionally possesses a
portable police radio commits unlawful use of a police radio, a Class B
misdemeanor.
(b) This section does not apply to:
(1) a governmental entity;
(2) a regularly employed law enforcement officer;
(3) a common carrier of persons for hire whose vehicles are
used in emergency service;
(4) a public service or utility company whose vehicles are
used in emergency service;
(5) a person who has written permission from the chief
executive officer of a law enforcement agency to possess a portable police
radio;
(6) a person who holds an amateur radio license issued by the
Federal Communications Commission;
(7) a person who uses a portable police radio only in his
dwelling or place of business;
(8) a person:
(A) who is regularly engaged in news gathering
activities;
(B) who is employed by a newspaper qualified to
receive legal advertisements under IC 5-3-1, a wire service, or a licensed

commercial or public radio or television station; and
(C) whose name is furnished by his employer to the
chief executive officer of a law enforcement agency in the county in which
the employer's principal office is located; or
(9) a person engaged in the business of manufacturing or
selling portable police radios.
(c) "Portable police radio" means a radio receiving set that is
capable of receiving signals transmitted on frequencies assigned by the
Federal Communications commission for police emergency purposes and that:
(1) can be installed, maintained, or operated in a vehicle; or
(2) can be operated while it is being carried by an
individual.

This term does not include a radio designed for use only in a dwelling. As added by Acts 1977, P.L.342, SEC.1.

In the US, the band 128.825 - 132.000 MHz is allocated to Aero Enroute.
Service is provided to the airlines by Aeronautical Radio, Inc, who connect
the planes and company dispatchers. At a guess, you heard an inter-office
communication that was accidently patched to an ARINC channel, or an open
mike in a dispatch office.

5231. 700 Club Baton Rouge Narcotics Div

Newsgroup: rec.radio.scanner
Date: 1995-06-18 00:00:00 UTC
From: tatkins@unix1.sncc.lsu.edu
Message-ID: <3s23ur$38a4@unix1.sncc.lsu.edu>
Source record: 253901

Is there anyway anyone can look up or check what the frequency is for the Baton Rouge, Louisiana Narcotics Division (called "The 700 Club"). I have heard that some of you dedicated scanner buffs have access to those FCC microfiche and other resources for hard-to-find frequencies. Police Call had the regular Baton Rouge City Police frequencies (4 channels for the 4 divisions) but did not show the B.R. City Police Narcotics Division frequency. I would appreciate it if someone could find out.

I heard that the Narcotics channel was particularly interesting to listen to as you can heard major drug busts going on. Good for some listening excitement on a Saturday night. Thanks.

You can use coax cable as an antenna. Simply strip the cable down and
remove the copper ground braid leaving the center conductor encased in
plastic. I have used coax as an antenna for my handheld with good results.
JOHN

to clarity CATV, connecting a cable television coax to a scanner will not
work all that well, you will get some signals but in strange places. I
had a scanner located near a television that was connected to the CATV, I
got some signals in strange places (UHF-aircraft, where there normally
isn't much activity... JOHN

BC>licensed, but there seems to be a lot of activity with Motorola UHF
BC>portables (by the truckload)... and the low band freq has absolutely no
BC>activity on it. HELP! Thanks.

Lots of major events rent radios from commercial providers. There is
no specific plan on how or what freqs the rental company can use. I'd
suggest running three scanners in this fashion.

1.) Search the 456-460 Mhz Band looking for (as I call them B.S.)
odd-ball business channels ala: Mc'Ds etc.

2.) Search 461.0000 Mhz thru 470.0000 Mhz in 12.5 Khz steps as
sometimes they use splinter channels or even input freqs on
simplex.

3.) Third scanner is to listen to all the freq's you have found.

Happy hunting.

Source record: 253908

RE GPS Reference signals, or Differential GPS.
I found that in a 24 hour period a graph showed the exact position.
I had the oportunity to use DGPS with an update via a UHF Link
and if the link dropped out the track error or position would jump
on average 20 meters. The altitude had greater error and it seems
the military value of Altitude information must be great.

With the DGPS on very accurate tracks at 180 KTS of plus or minus
5 meters and plus or minus 10 feet of altitude could be maintained.
When the DPS dropped out to convential GPS we would just fly the
heading for a while, ignor the normal GPS and very slowly converge
to the convential GPS track over a 30 second period.
The GPS differential does not jump wildly all over the place
but rather slowly migrates in lat , long and altitude.
Each appears to have its own "wandering factor" each moving
slowly. Hope this helps the last post about this.
Regards
Roger Townsend
Ontario
Canada.

I have just thrown out several years of electronics magasines
and now need some infor that I am sure scanner enthusiasts will
have , possibly in "Pop coms" etc.
I am looking for the adverts about ESN numbers, Cloning,
software for EPROMS etc. There was also some books that had
a wealth of information about the significance of various
codes etc. also
Also I recall seeing at one stage an advert for software to
monitor data traffic on cell phone control freqs etc.
There was also another book specifically about Motorola EPROMS
and kits for programing them etc.

Regards
Roger

-> Does anyone know where to find a good database of San Jose and South
-> Clara County Freq's. There used to be a BBS but it seems to have dis
-> in the last few months.

Ray:
The Santa Clara County Sheriff's Office BBS, "SOLIS" has a complete list of Santa Clara County Public Safety Frequencies. The file is "SCCFREQ.TXT". You must register as a user on the BBS first and will have full access to the File Area within 24 hrs (normal turn around time). The list was updated on 06-18-95 (because I did it!). The BBS can be reached at (408)971-2301 or (408)741-8012. The same file will be available as a Web page within the week on the S/O home page. The URL is: http://www.amdahl.com/ext/scc-so/. I expect to have the home page updated by Thurs.

Let me know if I can be of any other assistance.

Don't know of any such listing on the Net...but I do know of some examples:

WAMU 88.5 Washington DC Korean
WPFW 89.3 Washington DC Farsi
WETA 90.9 Washington DC RBDS data
WESM 91.3 Prince Anne, MD radio reading program for blind
WPGC 95.5 MD Korean
WASH 97.1 Washington DC Spanish (relay of WMDO-1540?)
WXTR 104.1 Waldorf, MD Spanish
104.7 Hagerstown, MD sporting events (IFB?)
WFSI 107.9 Annapolis, MD Haitian

Ok, ok, I'm sorry.
Your local fire brigade may be using AM because that's what they got when they got it, and have seen no reason (or have been unable to afford) to upgrade.

H> look forward to in the next few months??

Good questions! The answers may be somewhat along the lines of: they sell almost all they make, so why bother making them different, only to boost sales? While I'm certain this isn't the only answer, it does have some truth to it.
As Bill Cheek has pointed out, the makers of scanners (or at least those who determine the features) don't seem to be too much in touch with what we want. Look at the PRO-2035: 1000 channels, but in 10 banks! They KNOW that's unwieldly, but they did it anyway. And, no S-Meter. Why? Cost? Hogwash - the cheapest CB rigs have S-meters.
We've been complaining about these things for years, but the powers-that-be don't seem to listen to us.
Why? Obviously, there's a reason. Since the companies are in business to make money, and NOT to piss us off, the reason has to be a business one. Since almost all business decisions, and ALL decisions dealing with product design, deal with the "bottom line", we must believe that the reasons for this are driven by the bottom line, as well. Since we have told them that something like an S-Meter will enhance sales, and they don't include an S-Meter, we must believe that they think adding one won't enhance their bottom line. IOW, they are selling enough, thank you, and see no need to change a design to increase demand. Sad, isn't it?

TJ> The best-sounding (no pun) reason I've heard is that by the time
TJ> FM technology was practical, AM was too firmly entrenched in
TJ> worldwide aviation to make a changeover feasible.

The real reason is that FM has a capture effect; when two FM radios transmit onthe same frequency, the receiver will process the stronger signal, and block the weaker signal. In air travel safety, this is not acceptable. A weaker MAYDAY call would be blocked by a stronger call. With AM, both would be (and are) heard. Even if the weaker AM call were too weak top be heasrd, a heterodyne would be heard, alerting a listener that two calls were being made, and allowint the controller to ask for the weaker transmitter to re-transmit. This is not possible with FM.

I don't understand why they only have to have a "generic" license for 800 band. If you get a copy of microfishe or other resource showing licenses then you will see lots and lots of companies licensed on 806 and 821 Mhz. this is just the lowest number of the Business license I guess.

I'm also trying to find a private Ambulance company.. I know they are on 800 trunked.. I have heard them while searching but just don't have the patience to sit there and scan all the 800 frequencies and start writing down every time I hear them. There are literally hundreds of business that share this band. The only license I have found is the 806/821 "generic" license.

Ds> clear up all speech inversion transmissions. I suppose the
Ds> new SS-70 could be better, but I'm not gonna try it.

As the guy says the SS-7 doesnt do much to descramble. The SS-70 does but has a very high background hiss and very unatural descammbled sound. With some effort youll be able to understand the conversation. If any of your other audio equipment sounded that bad you would be unhappy. On the other hand I dont know of any other easily available options. Guess it depends on how much you gotta hear what thier saying.

Here's what I remember off the top of my head...

Tower 118.3
Clearance Delivery 118.85
NY Approach 128.55
NY Departure 119.2
ATIS 134.825

The tower must be a very low power transmitter. I can't hear it from my home (about 12 NM away). In fact, I sometimes take my son to the airport, and the audio is very low there as well.

Have fun.

Try searching the following, you'll have guaranteed hits:

30 - 30.56 Mhz
32 - 33
34 - 35
36 - 37
38 - 39
40 - 42

Most Amry/ANG field/training and convoy action here in Maryland has been
heard in this range. Low Band skip was HOT this week and I heard Louisianna
ANG on 38.4 Mhz during live fire range testing. Good luck, keep us posted.

>Ken Morrill <kmorrill@strauss.udel.edu>

I noticed that on my SS-70 as well--it contributes a significant amount of white noise to the recovered audio.

The only other solution I know is a circuit based on an article someone wrote in an electronics magazine some time ago. It uses a CODEC chip to move the inverted audio into the digital domain. There, the polarity of every other sample was inverted by inverting the sign bit of the sample's amplitude. The altered data stream was then fed into the decoder portion of the chip. The recovered audio was nice and clean (the CODEC is designed for digital telephone service). The inversion center frequency is one-fourth of the sampling rate.

I proto'ed this circuit and had excellent results with it. However I've yet to build myself a permanent version of it.

Try a Ramsey Electronics SS-70. One caveat--the kit injects a fair
amount of white noise into the recovered audio.

yeah, add 21.4MHz (a typical double conversion IF) to the frequency, and what do you get? 152.750. last i checked, that's one of the old imts mobile phone frequencies, still in use by a few people in a few places...

5267. FOR SALE-UNIDEN/BEARCAT 200XLT

Newsgroup: rec.radio.scanner
Date: 1995-06-19 00:00:00 UTC
From: along@clark.net
Message-ID: <along-190695135706@along.clark.net>
Source record: 253843

FOR SALE!!!

Uniden/Bearcat BC 200 XLT-Scanning Radio

$170 or best offer. I'll Pick up the Shipping Charges!!!

Great Condition!!
NEVER been Dropped!!
Kept & Handled with Care and Respect!!

Features Included:

-- 200 Channels (10-20 channel Banks w/ 10 Priority Channels)
-- 12 Bands + Instant Weather Button:

10 Meter Ham: 29.00-29.70 MHz
VHF-Low: 29.70-50.00 MHz
6 Meter Ham: 50.00-54.00 MHz
Aircraft: 118.0-136.0 MHz
Military Land Mobile: 136.0-144.0 MHz
2 Meter Ham: 144.0-148.0 MHz
VHF-High: 148.0-174.0 MHz
Federal Gov't: 406.0-420.0 MHz
70cm Ham: 420.0-450.0 MHz
UHF: 450.0-470.0 MHz
UHF-T Band: 470.0-512.0 MHz
800 MHZ: 806.0-956.0 MHz Including Celluar Band!!

-- Scanner Speed: 15 channels/second
-- Search Speed: 25 Frequencies/second
-- Illuminated Green lighted LCD
-- 12 VDC Power (Rechargable NiCad Battery Pack & AC Adaptor Cord)
-- Flex Antenna w/ BNC Connector
-- Earphone & Shirt Clip Extension Speaker (Both w/MiniPlug Adaptors)
-- Leather Carry Case w/ Belt Loop
-- Operating Guide
-- And More!!!

Great for a first time buyer or for extra carring unit!!!
***Fully Further Modifiable--Instructions included.

Contact Andy for full details...

If you are talking about the discone, it should not be grounded. If you are talking about one of the
other RS antennas, technically it should be grounded. If you get lightning in your area you may
vaporize your radios. Problem is, it you ground the antenna, you probably increase your chances of
getting struck by lightning! You should mount a lightning rod higher than any of your antennas. It is
just a gamble. So, do you feel lucky?

TR>They are all in the 40 Mhz range. Just search there, and you'll find
TR>them!

try being a bit more specific. either be of some help or don't bother.

santa rosa mobile 42.660 base 42.880
corte madera 42.640 42.160
san francisco 42.760 42.440
redwood city 42.820 42.080
san jose 42.280 42.500
hayward & dublin 42.840 42.620
oakland 42.400 42.120
napa 42.660 42.880
fairfield 42.020 42.600
martinez 42.740 42.920
statewide blue 42.180 42.340

mobile extenders can be heard on 154.905MHz, with varying ctcss tones
depending on district...

all pl tones for the low band frequencies for the bay area are 131.8Hz

listen for aircraft on 42.500 and 45.020.

for best results, use a 1/4 wavelength groudplane antenna. however, a
full length 9ft CB whip with a good groundplane works fairly well.

Message-ID: <trevor-1906951610250001@c18.globalvision.net>
Source record: 253847

AHA! Finally, a scientific explanation. I am certainly picking up cellular phone conversations in the range from about 900MHz to 920MHz on my Sportcat 150. It is a newly designed receiver, but it doesn't surprise me that Uniden didn't bother to make it less susceptible to images. I am certain that these calls are cellular phones. I just figured it was older cellphones in an unblocked range of frequencies. The frequencies are quite predictable and if I actually listened to the conversations, I might be able to identify the same people over and over again. :-)

What I really want is that downconverter which allows me to listen to the 200-400 MHz range....

>>more wind noise and the occasional police siren.

SC> Hmmm..... pardon me, but isn't there a significant difference in the
SC> speeds between a car and an airplane?

Yes, but let's do some math:
First, for sound:
Sound travels at (let's be generous here) 750 MPH at sea level.
That's 2.08 MPS (we'll see why we convert to MPS in a moment...)
So, let's take an audio tone at 2400 Hz (call it a train whistle).
At a speed of 60 MPH, the doppler shift would be:
60/750=.08, or an 8% shift of 2400Hz, or a doppler shift of
192 Hz. This is something we can actually hear.

Now, at radio speeds (186000 MPS), let's do the same thing...
Aircraft speed (again, be generous)= 800 MPH or 2.23 MPS.
2.23/186000 = .00119% doppler shift, for:
.285 Hz doppler shift on the same 2400 Hz tone. *NOT* something we'd
notice by ear.
(We converted to MPS, to keep everything even)

So, doppler shift is NOT the reason we use AM for aircraft comms.
So, why *IS* AM used? Because of the capture effect of FM.

5275. Twilight years of radio monitoring?

Newsgroup: rec.radio.scanner
Date: 1995-06-19 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DAFr7D.Hs7@ennews.eas.asu.edu>
Source record: 253851

I've been reading a lot lately which seems to indicate that the era of public service radio monitoring is rapidly coming to an end.

As I'm sure you're all aware, Kansas City, MO is (or will be soon) operating a fully digital system. Police transmissions are digitally encrypted, and all other city transmissions are in an unencrypted digital format. I don't think that one can even monitor the garbage man (garbage person?) in KCMO. I don't know about you, but I've never seen a scanner capable of receiving even unencrypted digital transmissions.

As I understand it, APCO Project 25 involves converting all public service radios to a digital voice format within the next several years. (I don't recall the exact number, but I am pretty sure that it was less than 10 or 15). Furthermore, Project 25 will use proprietary technology which will require licensing. How many scanner manufacturers do you think they will sell licenses to? Probably the same number of scanner companies that are licensed to manufacture trunked-capable scanners right now.

Does anyone out there have any more specific information about when some of these changes are slated to take place, and what, if anything, the scanner manufacturers are doing to try to keep up with the changing technology?

Please respond in this newsgroup.

5276. AOR2700

Newsgroup: rec.radio.scanner
Date: 1995-06-19 00:00:00 UTC
From: barry@advantage.com
Message-ID: <barry-190695162559@mac_barry.advantage.com>
Source record: 253852

There was a message last week providing a review of the new AOR2700 radio. Unfortunately I have been unable to get email through to the author so am resorting to posting to the news group.

Thanks in advance to anyone who can offer feedback.

I have seen the scanner here in Canada, they call it an AOR2700-G, saying that it is "Government Issue". There are no gaps in the frequency range and appears to be a great radio. I currently have a PRO-43 and wish to "upgrade"

Can anyone offer any comments as to the 2700 versus the 8000? Can anyone also offer any thoughts on pricing. The price I have locally for the 2700 is $499 US. This may be high given the price for the 8000 at the same place is $799 and it is available @ Comsec for $589.

Thanks.

Barry

Although I'm not a lawyer, I don't think the tape is tainted evidence. The tainted evidence rule applies only if the authorities broke the law to obtain the evidence. For example, let's say you buy a really nice scanner for a great price on a street corner. Later you find out that the scanner was stolen, (Duh?) and you turn the scanner over to the police along with a description of the person who sold you the scanner and the license number of his van that had

all that other neat stuff in it. The police can and will use the scanner as evidence even though you obtained it illegaly (you purchased stolen property).

The tainted evidence rule was designed to keep the authorities in line.

If the user (perhaps a hospital) is using an SMR service, the FCC does not license the user for all of the SMR's channels. They just get one, generic license to be on 800 via the licensed SMR. The SMR operator is the one that will have the license for the specific channels. The FCC does this in an effort to streamline the licensing process. No need to license an SMR subscriber for specifc channels.

If your are seeing lots of companies licensed on 806 and 821 they are probably subscribing to a trunked SMR (or equivalant) service. They don't actually operate the system themselves.

>I'm also trying to find a private Ambulance company.. I know they are on

Find out who operates their radio system - that operator is likely the trunked system licensee and is licensed for specific trunked channels.

UN ARMY ON US SOIL

WASHINGTON - For the first time on U.S. soil, NATO soldiers
will hold a peacekeeping exercise with troops of the former Warsaw
Pact, the Pentagon announced Friday.
The exercise, called Cooperative Nugget '95, will be held Aug. 6-28
at Fort Polk, La.
About 4,200 troops from 14 central and eastern European countries
as
well as the United States, Canada and Britain will participate. Nine
countries will send observers, including France, Austria and the
former
Soviet republic of Georgia.
Partnership for Peace, but the first in the United States.
The Clinton administration had wanted Russia to participate in the
August peacekeeping exercise, but Moscow has made no commitment. A
joint U.S.-Russian peacekeeping exercise, separate from the Fort Polk
event, is to be held in Kansas in October.
At the Fort Polk exercise, each participating country will
contribute a rifle platoon. The platoons will be combined to form a
NATO-Partnership for Peace battalion. The national contingents will
receive linguistic and technical support from elements of the 10th
Special Forces Group, from Fort Carson, Colo.
Of the approximately 2,500 U.S. troops participating, most will be
from the Army's 2nd Armored Cavalry Regiment based at Fort Polk, said
Maj. Walter Thorp, a spokesman at U.S. Atlantic Command, which is
helping organize the exercise.
The non-NATO countries scheduled to participate are Albania,
Bulgaria, the Czech Republic, Estonia, Hungary, Kyrgyzstan, Latvia,
Lithuania, Poland, Romania, the Slovac Republic, Slovenia, Ukraine and
Uzbekistan. Each is expected to contribute between 30 and 40 soldiers
plus about 10 to act as observer-controllers.

I also have the RS Discone antenna, only mounted on 10 foot mast off of
a three foot tripod on the roof. Connected to a BC200XLT produces
excellent results. However, for a cheap test, I ended up using a
57 inch stainless steel whip attatched to the top of the discone via
a 3/8-16 to 3/8-24 threaded coupler to allow well matched performance
for my 11 meter base transiever. Kinda makes it dual purpose that way.
I didn't perform any whiz-bang math to achieve the 57 inches for the
whip. I just used the SWAG method (scientific wild ass guess).
But really, I started out with a 102 inch whip and just kept snipping it
down until I got a 1.2:1 match on my base CB. For me that match is safe
enough for my old Cobra base. The only scanner reception difference I
noticed was some enhancement to the 49 MHz band. That's about it....

Source record: 253794

A big THANK YOU to all of you who sent info on the PRO-2006 unit and mods. I drove up to Radio Shack in Vancouver, Cananda on Saturday to pick up the scanner (pd. about US$285 not including taxes) and performed the cell restoration and scan speed mods before I even plugged it in (took about two minutes) ;-)

This is my first scanner and I haven't been able to leave the house since I got the unit home. It's now connected to a $17.99 Radio Shack antenna (20", VHF-Hi/UHF) on my apt. porch by a 20' piece of RG-58 coax. I bought a copy of 'Police Call' and have been pretty much sitting in the same spot in front of my radio ever since.

My only problem (in addition to figuring out the optimum way to organize the memory banks--it's unbelievable how much time one can take planning out freqs in the different banks) is interference from cable TV stations. For example, limit searching between about 800 MHz and 1,300 continually finds the same religious TV channel signal spaced in precise 4 MHz increments. Is there a way to fix this?

Also, any tips on scanning in the 225-400 MHz military air band? I've tried a limit scan of this band in AM mode with differing steps and haven't found a thing. For that matter, most federal freqs I try come up empty.

Any suggestions or comments on my setup are, as always, greatly appreciated.

Thanks from a new scanner hobbyist!
Mark Schneider <markschn@u.washington.edu>

Barry J. Cotter (barry@advantage.com) wrote:
: There was a message last week providing a review of the new AOR2700 radio.
: Unfortunately I have been unable to get email through to the author so am
: resorting to posting to the news group.

Hi Barry. That was me and I don't know why your email didn't get through
to me.

: I have seen the scanner here in Canada, they call it an AOR2700-G, saying
: that it is "Government Issue". There are no gaps in the frequency range
: and appears to be a great radio. I currently have a PRO-43 and wish to
: "upgrade"

I don't know anything about the "-G" suffix, but I bought my AR2700 here
in Canada. I also had a PRO-43, and I consider the AR2700 to be a great
improvement. (Although the PRO-43 provided me with many years of
enjoyment.) Oh yeah, my 2700 has no gaps.

: Can anyone offer any comments as to the 2700 versus the 8000? Can anyone
: also offer any thoughts on pricing. The price I have locally for the 2700
: is $499 US. This may be high given the price for the 8000 at the same
: place is $799 and it is available @ Comsec for $589.

From what I can tell, the 8000 has more user-adjustable parameters,
more channels, more modes (like SSB), and some user-definable text
on the display (I think it lets you give a short description of each
channel). If you have to stick with the prices you gave, then the
2700 is a much better deal than the 8000. I would pay no more than
Cdn $150-$200 to upgrade my 2700 to an 8000. On the other hand,
US $589 sounds tempting for the 8000...

I don't know what the AR2700 retails for in Canada, as I received mine
as a replacement for a faulty AR1500. I paid Cdn $600 for the 1500
(a price I now believe was too high), but it turned out to be a good
price for the 2700.

Let me know if you want to know anything else.

I am considering purchasing an AOR 2700 from Javiation and was wordering if any other scanner enthusiats have done business with them. I would like to know if its "safe" to import this scanner with our customs and laws in the US. Also is the performance improvement my RS Pro 37 going to justify the additional $450 spent on the scanner? Is the record chip option worth purchasing? Any replies to pzman@nwrain.com would be greatly appreciated. Thanks Keith.

I've done it and there are no drawbacks from it. But it is equally silly that
the unit would have one diode to block the cellular. Also, if you want to do
other mods to the unit, you should pick up the service manual.

rc> "generic" license.

There is only a "GENERIC" license for these USERS as they may transmit from
about 806-821MHZ depending on where the SERVICE PROVIDER is licensed.

To cross reference this GENERIC LICENSE to the actual system your data must
contain the "SMRS" field. Looking up the callsign listed here will give the
system frequencies. Some online providers also can provide lists of all users
for various SMR systems.

I suspect it is the fault of a SYSOP. The Roy Hobbs BBS is run by Cono Delrosso, N2UTO from somewhere in New Jersey; Teaneck, Little Ferry, Lodi, or Moonachie and maybe others.

I lost $200 when I tried to buy a Pro-43 scanner from him. I would imagine that people trying to sell stuff have a harder time because so many people have been ripped off. I have certainly learned my lesson.

When I sent the money, I was confident that I could trust the guy. After all he included his phone number with his electronic ad, he is a licensed Amateur Radio Operator, and he appears to be SYSOP of a big BBS with lots of users. That may explain why he tried to make it look like all messages received at his BBS originated there. He probably didn't know how mad people would get when they received hundreds of duplicate messages. Also he appears to be a BBS and FidoNet expert -- he puts out BBS lists. Appearances can be deceiving :(

> you never heard it?? Yea I bet.

I remember when scanning used to be a hobby. Some people could and would help find transmitters when the need arose. If you were in danger and couldn't tell a 911 operator how to find you, you would wish for some scanner hobbiest to come find you. Now it would be illegal even if the scannist had an old radio that would work on the cell phone frequencies.

.. When scanners are outlawed, only outlaws will have scanners

Summary:
Keywords:

The kids found my old Coleco football game and my old 8-channel scanner
in the attic. A nine-volt sufficed for the Coleco, but now,
I am looking for some crystals for an old Realistic Pro-25 8 channel
scanner. Radio Shack used to trade for free, but they now want $9.95
to order new crystals for local frequencies. Not worth it...

I'll give away or trade the following freqs.

154.770mhz Santa Cruz Police
463.050mhz Med. 3 Santa Cruz
468.050mhz Unknown
155.625mhz Capitola Police
154.415mhz County Fire - Blue

I am looking for:

155.085mhz Scotts Valley Police
155.940mhz Scotts Valley Police
154.920mhz Mutual Aid White

Any non-scrambled CHP - perhaps:

42.240mhz Green Mobile
42.540mhz Green Base
42.300mhz Black Mobile
42.460mhz Black Base
42.180mhz Blue Statewide

Email or call at (408)438-4145 (home)

There are too many to list for the Chicago area!!! I live 15 miles from
downtown and I have a hell of a time keeping my frequencies organized.
Your best bet would be to pick up a book at radio shack to find what you
actually want to listen to. If your not from a metropolitan area, you
might want to listen to Chicago Police in the 460's. You'll hear
shootings, stabbings, gang fights, etc... but it gets sort of repetitious.

Hi Dave,

You can download some demos of the best programs via ftp
from ftp.demon.co.uk /pub/ham/scanners

on the site the best i've seen is scan*star - sscom.exe
it's been crippled but will give him a good idea what the
software can do.

Hi,

There are currently some 27FW "CC" F-111's on deployment to RAF Fairford. They have been "channelised" to some degree for local ATC frequencies but are using Button 1 for Ops.

Would anybody have a reference to such a frequency in use at Cannon AFB they could perhaps post that they maybe using over here or any suggestions that might come up trumps.

Thanks alot.

>
>

Modification for the Uniden BC700a to enable scanning of entire
800mhz band. The Radio Shack Pro 2038 looks to be the same radio
and the mod may work but I have only worked on one BC700a.

Cell frequencys can be restored by simply bringing pin 10 of the
processor chip to logic 0. Pin 10 is an I/O port pulled high by R214,
a 4.7K surface mount resistor on the Control PCB. The processor chip
is IC201 on the control PCB. The control PCB is mounted to the front
panel and is a little tricky to get to as you will need to disconnect
the 10pin ribbon cable at J4 and then unsolder the copper shield plate
that covers the processor. J4 is a zero insertion force socket and
the cable be be removed and reinstalled by pressing down on the top of
socket while removing/inserting the cable leads. You can lift the shield
by unsoldering the the two outside points. Pin 10 can be brought to logic
0 by soldering a jumper at the first pad on the trace coming from Pin 10
to the adjacent pad on the ground trace that runs to pins 12 & 14. The
processor chip pins are numbered consecutively counter-clockwise with
pin 1 to the right of the notched corner when viewed from the top.

That's all it takes. All work is done from the back of the control pcb.
You will not need to remove the pcb from the front panel. When you
disconnect the cable from J4, all programmable memory locations will be
cleared so write down anything you want to keep. Finally, the program
seems to only read the I/O port at powerup, so if you are experimenting
you will need to cycle the power in order for the unit to recognize the
modification. You should now have uninterrupted coverage from from 806
to 956 mhz.

Enjoy,
Mike Kenny

The problem sounds more like a crystal is out of tolerance, and due to the freq. multiplication is more evident on 800 Mhz. You can either get a replacement crystal yourself and retune to specs (get the service manual, of course) or send it to be done in a shop, preferably Grove or other non-RS center since they are notorious for sending you a non-modifable replacement (they usually swap a board).

Ft. Polk is the home of the Joint Readiness Training Center. I was there last summer for 3 weeks as an exercise controller, and as I recall the freqs used by the controllers (exercise umpires) were between 400 and 410 MHz (trunked). The list given above will definitely get you the "player" communications -- both Army/ARNG and OPFOR (opposing forces). The players use SINCGARS FM frequency hopping radios in the fixed frequency (non-hopping) mode with no COMSEC (voice encryption) so you should be able to hear some pretty interesting activity, especially in the evening and early morning hours when most attacks commence.

It's pretty easy to tell the Army/ARNG players from the OPFOR players. The OPFOR players generally use non-standard radio telephone procedures (call signs, map grid encryption, and the like). So if you hear "Papa Smurf" talking to the "Marlboro Man", you can pretty much bet that you are monitoring OPFOR traffic.

>
>

No... it's definitely cell stuff.. at least in my area. I also have the SportCat 150 and it seems that between 850 and 900 I get a lot of radio traffic.. utility crews and such, but the occassional cell phone or other phone hits that range.

Between 900 and as high as near 950 I pick up cell phones.. or their images.. or something. All I know is that they ARE in fact, cell phones.

More than one occasion, driving down the road with it or sitting at home or someplace, I've heard people making reference to the cell phones they were using.

Also, a good 90% of the corldesses in that range these days are scrambled (not that it's always that good, some just sound like someone with a voice alterer.. still easily understood).

The cell phones emit this little squerch-beep sound every now and then. It seems to be at regular intervals, but I've never timed it. I think what they do is poll the cell to find out if they are on an ok frequency.. this is especially important when moving from cell to cell since you could conceivably be on the same freq as someone else, so it needs to shift FAST.

Sometimes immediately after one of the tones, the voice will get suddenly louder then disappear. Sometimes within only a few MHz offset... Don't know if it only does that when you change cells or what.

Also, I found, that some cell phones or the frequencies that they use, when NOT in use, have those really annoying data-like signals riding on them. I'm wondering if they do that so people don't sit on the frequencies waiting for someone to use a cell phone. Most are quiet though and don't do stuff like that.

I sat on one freq one night and every tone or every other tone the conversation would get blipped over to some other freq and almost always be immediate replaced by another conversation.

Wondering if that was the cell phone equivalent of a temporary storage space until it figured out what freq it should send it to. Weird stuff.

I'm VERY new at all this, but I know a little about communications... hope this helped some people and I hope it's actually accurate... it's just my personal observations on the subject... I want to learn vastly more though, so help notes would be appreciated.

Thanks.

5344. Surplus A-7 Spiral Antenna?

Newsgroup: rec.radio.scanner
Date: 1995-06-20 00:00:00 UTC
From: hl1@hudson21.acpub.duke.edu
Message-ID: <3s775t$p2o@news.duke.edu>
Source record: 253876

I recently ordered a "A-7 Aircraft Electronic Countermeasures Antenna" from a surplus outfit called Electronic Goldmine. They said this antenna made of two spiral metallic foils wrapped around a pointed conical base that had a length of approximately 5 1/4 inches. The coax connection was tnc, and the antenna was said to be "heavily built and waterproofed, and enhanced the reception of a scanner above 800 MHz."

I was ordering some other stuff, and the antenna was only $8, so I said, "what the hey," and added it to my order.

Can anyone on the net tell me what I bought?

I am a little familar with helical antennas, but what happens if you decrease the diameter of the helix out toward the end by making it a tightening spiral? Does this narrow or widen the bandwidth? Is the antenna still directional?

My apologies to those on this Usenet who may have had any trouble in
sending their responses to my E-mail to them. This BBS has been having
BIG problems with the incoming Internet E-mail ever since late April.
Since this Usenet group may not be updated at this end on a daily
basis, there would be no certainty in trying to conduct any 2-way by
posting the messages on here alone.
So, if any wish to try it again, I now have an alternative route:

Which brings me to one question: Why am I receiving 900MHz transmissions
on 160MHz? They come in loud and clear. The transmissions seem to originate
from the 900MHz AMPS cellular phone system in use here.

> channel) and he was able to pick up many, many conversations.

It sounds like your friend is picking up cellular "images". That is,
what he is hearing is really being broadcast in the cellular phone band,
but since your scanner is higher quality and uses triple conversion, it
is less susceptible to receiving images...

How do you know what your friend is picking up aren't cellular images?

Since you said your friend has a new 80 channel RS scanner, it's a good
bet his scanner does not use triple conversion. Only top-end RS scanners
use triple conversion and they all have much more than 80 channels.

>Agreed. The Radio Shack telescoping antenna really makes a dramatic
improvement.
<

I recently purchased this particular antenna for use with a Pro 39. I too, have found that it really helps on the low frequencies, but have not been able to determine if it helps on the higher, like the 460 or 800 frequencies. It seems at these higher bands, the rubber ducky works just as well. I was thinking about returning it since at home I have an outside antenna that far outdoes the telescoping one at the low end. But even wiht the outside roof antenna, I haven't really noticed much more on the high bands. Has anybody else noticed an improvement in e high bands with the telescoping one?

Thanks,
Drew

There are thousands of them. How many do you want?
If you get this in time, tonight (6-21), at 6:00 PM, there will be a
get-together of radio listeners, at Denny's, on the NW corner of I-17 &
Dunlap. You can get freqs to your heart's content, there.
Also, Radio Shack sells POLICE CALL, which will have a pretty decent listing
for the area. There are also a few comprehensive local frequency guides.
These sources can provide you with far more than you can get here.

Stick with the outdoor antenna. You might not notice a
difference because of the feedline. Go to a low loss
coax cable.

Here in Las Vegas, I hear cell conversations up to 912 (the top range of my scanner). These are not images or cordless phones. I read that the phone companies are having to expand the cell range due to an increase in demand (due to lower costs and heavy marketing).

Trimmer capacitor TC102, located on the RF printed circuit board,
adjusts the frequency of the reference oscillator crystal to
12.799937 MHz plus or minus 2 Hz.

I recommend you spend the $8 or $10 and get a service manual.
It contains the complete alignment instructions, parts list,
schematic, PCB layout, etc.

There are no regulations with regard to bringing your scanner into the UK (What sort do u have ?). There are no restrictions on frequency coverage either.

As soon as you turn the thing on though you begin to enter the "grey zone".

The Wireless Telegraphy Act 1949 does not allow you to receive anything other than authorised Broadcast stations, Amateur Radio and CB transmissions together with weather or navigation information WHEN AT sea.

The listening to Aircraft (VHF/UHF) is just as illegal in the UK as listening to the Police, Fire, Ambulance, Cellular etc etc.

Airband listening is a very popular part of the "scene" here in the UK- visit any airfield civil or military especially somewhere like Heathrow or Mildenhall/Lakenheath and you will see an array of mag mount antennas that would do any inteligence (sp?) site proud.

The Radio Communictions Agency produce a A4 information sheet on the use of scanners (Form RA169, phone number +(0)171 215 2150). The reverse side of which has the following "Questions and answers":-

Is a licence needed to own a scanner ?
Not if is inherently incapable of tranmissions. But its use to listen in to private messages is an offence.

Does owning a scanner make a person liable to prosecution ?
No, but is use, except as permitted under section 5(b) of the Wireless Telepgrphy Act would.

Is it all right to listen as long as what is overheard is not disclosed ?
No, using radio equipment to listen in, except as provided for by Section 5(b) is an offence, regardless of whether the information is passed on.

Could I get "authority" from the Secretary Of State to listen to the emergency and martime and aeronatical services. I am interested in them and wish to help ?
No, the Secretary oOf State's authority is usually reserved for persons acting at his request and on his behalf. If you wish to listen in to messages, you must obtain permission of the person

sending them.

Isn't this a bit heavy handed ?
No, no one likes their private conversations to be listened in to.
Parliament has passed the laws in question to protect the privacy of
radio users.

At the end of the day though providing you act "normally" (whatever that
may be) and don't go around chasing after Police Cars or similar there
is more channce of you Winning the National Lottery than being in
trouble for using your scanner.

The best book for general frequencies is the UK Scanning Directory
(costs 17.50 from most outlets).

Are you staying in London or moving around a little ?

You can recover some intelligible audio by listening to NFM audio in SSB mode. I think you actually have to tune a little below the frequency and then fine tune. Maybe someone can jump in and give the technical specifics to this method.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and |
1980s although some of the capacitor failures occur in the |
Uniden BC800XLT, too. Electra stamped all of its scanners
with a manufacturing date code on the rear of the cabinet.
The code is comprised of a single character (C =
Cumberland, Indiana, P = Puerto Rico), followed by four
digits denoting year and week the radio was built. For
example, "P8422" denotes the radio was made in the Puerto
Rico factory during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483. Uniden currently charges
a flat rate of $54 for scanner repairs. They will repair
and return "out of warranty" items without an estimate
unless the repair charges exceed the flat rate charges.
The phone number for repair is (800)297-1023.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands, but they don't sell manuals or schematics.
They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois (telephone 708-455-5105) has been repairing Bearcat scanners for several years. They charge a flat $45 repair rate for programmable and $30 for crystal scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've | fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the

supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics | in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd

electrolytic capacitor in series between the external
speaker jack and audio amplifier.

>other audio equipment sounded that bad you would be unhappy. On the other
>hand I dont know of any other easily available options. Guess it depends on
>how much you gotta hear what thier saying.
>
I find the background hiss to be relative. If you turn the volume up
on the SS-70 unit itself, then the hiss increases as well as the audio.
If, however, you increase the audio level into the SS-70 (turn up the
volume on your radio) and correspondingly decrease the gain on the SS-70
itself, the signal to noise ratio appears to improve.

There is still hiss, and it isn't perect. Like the previous poster said,
it depends on what it's worth to you.

By the way, I found that for my particular application (maybe others?)
that changing the frequency of the crystal significantly improved
the quality of audio, making it more natural. The supplied euro tv colorburst
xtal at 4.4 MHz still left a lot to be desired. Trying a 4.9152 xtal changed
it, but the problem was about the same "in the other direction" (with one
they sounded like on helium, the other sounded like playback in slow-mo).
The best compromise I found was a 4.75 MHz xtal that Radio Shack was able to
order for too much money (about $5). The usual suppliers (Digi-Key, et al)
don't stock anything between 4.4 and 4.9 MHz in the right can - at least they
didn't when I was looking.

The only other offering I have is that the "assembled" units - those built
by Ramsey - quickly went from $59 to $69 to $79 in a matter of months. I
take this to mean they sold like hotcakes, so the profit margin was fattened.
Just my opinion. Maybe that means other folks liked them, too? Anyway, you
should have much better performance than the ss-7 and its very irritating
whine.

Enjoy!

Fred

Hi Darian,
I went a step further. I made a printout of the law (copied from this board when someone posted it a year or so ago), ran it through the Xerox machine to reduce it in size so I could fold it and keep it in my wallet with my ham license, and I even used a yellow Hi-Liter to highlight the appropriate parts of the law (the ham exemption). Makes me feel quite safe when I'm traveling in Indiana. ---Dan

YES: IT IS UNLAWFUL to operate a scanner in any mobile setting in Indiana unless you obtain a license from the local POLICE or you hold a HAM LICENSE. TO OBTAIN A LICENSE FROM YOUR LOCAL POLICE DEPARTMENT, arrange to meet with whoever is in charge of those procedures. Generally, obtaining a permit to operate a scanner is not difficult, and usually you can get by with it unless you have SEVERAL felonies in your record. The criminal history check is the only thing that could really get you. IF YOU ALREADY HOLD AN AMATEUR RADIO LICENSE, you DO NOT need to obtain a local permit from the police department. HOWEVER, you should carry a copy of your license with you AT ALL TIMES (which you should be doing anyway), plus a copy of local laws regarding operation of a scanning radio with an amateur radio license.
OTHER EXEMPTIONS FROM ANTI-SCANNER LAWS INCLUDE:
>> REACT members licensed in the GMRS service, who are also equipped with GMRS transceivers to contact proper authorities in an emergency
>> Crime Watch Groups authorized by local government officials, but not necessarily the police department.
>> Red Cross members on duty or standby to provide assistance
I am a REACT member here in Virginia, and I keep a copy of my GMRS license with me at all times, even though the anti-scanner laws DO NOT APPLY IN VIRGINIA (except DC, and SOME localities). Now radar detectors, that's a different story...
Just thought I'd drop in and give my two cents. Best of luck with whatever solution you choose.

5397. Removing the metal shield on the PRO-43

Newsgroup: rec.radio.scanner
Date: 1995-06-22 00:00:00 UTC
From: wired@genes.pl.my
Message-ID: <803831158.-22224snx@genes.pl.my>
Source record: 253716

How do you guys remove the metal shield on the PRO-43 to do the cell and audio mod? Do you use desoldering guns or just an ordinary soldering iron and desoldering pump? I don't feel comfortable doing it with a normal soldering iron and desoldering pump - what if I `spilled' a gob of solder on one of the SMCs?

5398. Re: 900Mhz Cordless Phones?

>
>This is still new enough to be interesting, but many of the ads I've seen
>for the 900 MHz phones indicate that they are scrambled. Has anyone
>really heard a 900 MHz scrambled phone (and how would you know?) or is
>this more of the usual hype from the marketing people in the communication
>industry?

I have a Uniden 900 MHz digital spread spectrum phone, and have tested
to see what I could pull in on my receiver of this phone.

While the phone's in use, the only noticeable difference on 900 MHz is that
as I tuned across the frequencies in use, the white noise level rose slightly.
And as I tuned across, the S-meter slowly rose, peaked, then fell again.
This was only detectable with the squelch wide open; my PRO43's squelch
saw the white noise and just stayed shut.

> erfunc@aol.com

I'm located near SFO and like Erfunc also using an Airmaster. I
am receiving a high percent of air to ground and about 50 to 60 per cent
of ground to air(craft) transmissions. I would like to exchange my SFO
downloads of other areas particularly LHR,ORD,IAD or for than matter any
major airport.

One thing to remember about your friends scanner is that it is probably
double conversion and you may be hearing cell phone images in that 900
range on his scanner.

I used the normal soldering iron and a bulb pump. It was dicey!! It worked fine, but it was nervious time. I too, would like to know how others have done this.

Hmm.. well, I've been trying to see how broad the range is in this area, but I've picked up confirmed cell activity as low as 894.xxxx (can't remember).. havn't figured out an upper limit yet, only been doing it for a few days. But there's no doubt in my mind that they are cell phones.

As for the person earlier asking about cordless scrambling... the headset encodes the signal, beams it to the base which decodes it and sends it over the phone lines. Fairly simple actually.

I don't know either, but my friend and I were laughing about that the other day... he asked the same question, but our general (mildly intoxicated) opinion was.... who cares? as long as you can hear the conversation, eh?

I'm assuming that a natural frequency and not one of the echo'd or image frequencies would probably give you a clearer signal, but I don't know. Not one single clue actually. Just guessing.

T> Can anyone please help me???

It would appear that your friend's scanner is dual conversion, while your
'2006 is triple conversion.
This means that your friend's scanner is generating IMAGES of cellular
calls. This happens exactly as you are describing quite regularly on dual
conversion scanners. Yours, being triple conversion doesn't get images
anywhere as easily, so you don't hear what he hears.
Images are usually generated at twice the final IF frequency away from the
original frquency. This puts images of cell phones right in the area you are
looking. He's not hearing the new 900 MHz phones, he's hearing cell phones
on the wrong frequencies.
Hope this helps...

I'll bet they are images, as cell phones don't operate on those frequencies.
This is not something your local cell providers can do on their own; the FCC
would have to allot the channels, and this is something they haven't done.
What scanner are you using?

Don't buy the book thinking that after having this information you will be able to decode any DES encrypted radio traffic. The "Federal information processing standard" FIPS-1040 specifies DES. I found a copy of this at my college library. Nothing is secret about the algorithm. They could have a decoder in software on the disk (as long as they don't export it). Without knowlege of the key (or an enormous amout of computer horsepower for an exhaustive search) you will be wasting your time.

I will be more than happy to share my experience ordering from
Javiation. It is without question one of the "best" overseas vendor I
have personally worked with. The owner is very active in the hobby
and really knowledgeable about his products, unlike some U.S. dealers.
Roughly about one year, give or take a couple of months, I ordered
the Yupiteru-7100 from Javiation. The owner at Javiation gave me the
package tracking number to follow the journey into my hot hands. I
received my Yupi-7100 by FEDEX in two days! Upon arrival I noticed
that the unit was double boxed (the original was included), the
Yupi-7100 was brand new! (not a demo or refurbished unit that some
dealers try to sneek in!) and all the accessories. To top it off, I
got the best price that anyone could offer, the U.S. dollar was
stronger a year ago vs the British pound. I hope that is insight will
help you decide on a good dealer. Good luck with the AOR
8K.......looks good with the Opto- Scout Ver3.1.

Using my Motorola DPC and my Pro-43, I did a bit of testing as well.
Frequencies such as 903.375 MHz would pick up the call, but then drop
the call after 30 seconds or so...this with my holding the phone adjacent
to the scanner.

If anyone has any ideas for structuring further experimental work of this
nature, I would appreciate hearing them. Frankly, I was not impressed by
the results I was getting, but I don't know enough about said results to
comment in detail...yet.

5416. Anyone Using PRO-2035 with Opto-535?

Source record: 253735

I am looking for anyone who has been working with the PRO-2035 and the Optoelectronics 535 board. There are several questions that I have regarding the modification or adding the Opto 535.

(1) Did you have to make any cosmetic changes to the Pro-2035 when adding the Opto-535?

(2) How would you rate the quality of the Opto-535?

(3) The average time it took to install the Opto-535 inside the Pro-2035?

(4) What is your feedback during and after the entire install?

I'm sure that are plenty of proud PRO-2035 owners (like me) who would like to know the answers to these questions. Anyone thinking about getting a PRO-2035, all I can say is that it holds up very well compared to "high end" amateur and commercial receivers (the 10db attentuator must be on to kill any inter-mod). My Yupiteru MVT-7100 is neck and neck with the PRO-2035 in the sensitivity department (the Yupi-7100 is still the "Mike Tyson" of all scanners in the 1.2ghz and above!).

Lentini had them in stock when I called. I "had" (<vbg>) to have it and paid for the overnight shipping. They had the lowest price ($399) on them and had them in stock. Grove, EEB, and Opto were all priced higher and/or didn't have the v3.1's in stock.

> I hope this is of use to you. If you know of other teams that are going
> to be at the show, let me know and I will see what I have.

The frqs that will of the most use are vhf/uhf:

Ottawa arrival: 135.150/247.000 20 minutes out
Ottawa tower: 118.000/236.600 in the Control zone
Ottawa ground: 121.900/275.800
also try: 123.1000
CFB Base ops: 131.350/308.700 Base was closed recently but frqs may still
used for show?

As for comms there is very little chatter during the show all you'll
hear would be Snowbirds...smoke now, Snowbirds...break now.. Plug in
the frqs that someone else posted during Friday practice..

I think I saw that mod in alt.folklore.scanner.

Just kidding. If it is possible to increase the number of channels, I too would be interested. But 10,000 sounds like something unrealistic.

>Has anybody actually done this? It seems silly that the unit would have
>a diode whose only function is to SLOW its "hyperscan" rate.

Don't take my word for it but....

I heard that based on the parts which were originally available for
the (original) 2006, they had to purposely slow the scanner down.
Down the road, the faster components came up, so the just left the
scan rate alone.

If this is true, then the first couple series of 2006s would have
problems when the diode is clipped.

Also keep in mind that since this changes the clock rate (speeds it
up), the delay time is reduced.

:the law.
:
:The way I read the law is that if he is not ACTIVELY working as part of
:the ambulance crew, then he is a criminal under the law.

Exactly. What I was asking about was time spent off-duty in my personal vehicle (POV). Item (3) refers to "...vehicles used in emergency service..." which would not apply to my personal vehicle while off-duty.

And, you are also right, that you wouldn't think a cop would hassle someone that also works in the public safety sector...but you'd be surprised. Besides, it's always nicer when you can cite and display a state code to cover your butt. I patiently await the day when I will have to use this and watch the officer walk away mubling something about having to look THIS one up! :^)

Thought I would pass some recent information for you scanner/Percon users...

You can now purchase your Opto product and Percon database CD from one source... What's really nice is that you can save some money as Percon is bundling some of their CDs with certain Opto products.

Here is what I gathered.....

Opto Product	w/Percon CD Price
Scout (v3.1) Spectrum	$395
OS456 Spectrum	$270
OS535 Spectrum	$270
CX12AR I/F Spectrum Lite	$95
Clipmate	$25
DB32 Mini-Antenna	$27.50

$10 UPS Blue (2-day) S/H, slightly more for multiple products.

For more information, contact Percon @ 716-386-6015

Oh, almost forgot... No, I don't not work for Percon, nor do I can't any $$$ for passing this type of information onto others. Just trying to help people out.

5443. Re: Picking up Cellular on 902.0 - 915.0 ?

Newsgroup: rec.radio.scanner
Date: 1995-06-23 00:00:00 UTC
From: critchie@ix.netcom.com
Message-ID: <3sdk41$2mr@ixnews4.ix.netcom.com>
Source record: 253635

Lots of responses and questions to my original post, thought I would
post an email that was sent to me but wasn't posted in the group
because the author did not know if there would be much interest:

>In one of the mods, it says that no hardware modifications are
>necessary for cellular if you add 21.7Mhz to the cellular frequency
and
>manually enter it. I've found that I am picking up cellular between
>the 902.0-915.0 frequencies. I was wondering if this is specific to
>the BC200XLT or if my local cell sites are transmitting on these
>frequencies.
>
>Determining this will aid me in deciding whether or not to perform the
>new modification once I find it.
>
>
>Thanks
>
>critchie@ix.netcom.com
>
>
What you are experiencing is actually the 'image' of the cellular
transmissions in your receiver front end. It's not from the cell site
unless they are having some major technical problems.

When you receive at 902 Mhz the local oscillator (LO) in the scanner is
set to
a frequency one IF frequency lower than 902 Mhz. In your case the LO is

probably set to 891.15 (this is 902 - (21.7 / 2)). Your first
intermediate
frequency (IF) is tuned to 10.85 Mhz so when you mix 891.15 with the
spectrum
of incoming signals you get two images. The first is the sum of LO +
IF
(891.15 + 10.85) or 902 Mhz your desired frequency. The difference LO -
IF
(891.15 - 10.85) or 880.30 Mhz! Voila`, cellular reception. You can see
that
the 21.7 difference is dependent on the first IF of the particular
scanner.

This is a neat trick for receiving things that the microprocessor has
deemed
unreceivable, but is considered a negative factor for receiver

performance. If
the image you are receiving is trashing a real signal that you want to
listen
to ... well you get the idea. More expensive receivers like the Icom
R-7000
will up convert to an IF frequency that is way above the band that your
are
listening to to avoid just such a problem.

Source record: 253637

The newest mod for the recently manufactured versions of the Uniden BC200XLT are in the Ultimate Scanner 3 book. Haven't seen them posted on any mod servers, so if anyone has looked at the available mods and determined their scanner doesn't match the descriptions in the mod email me and I'll post the mod to the group.

This is the best book I've ever seen on scanning/mods/theory yet!

>The Wireless Telegraphy Act 1949 does not allow you to receive
>anything other than authorised Broadcast stations, Amateur Radio and
>CB transmissions together with weather or navigation information WHEN AT sea.

^^^^^^^^^^^^^^^^^
Does this mean that if you listen to weather or navigation information while on land you are breaking the law? This seems a rather silly law.

>The listening to Aircraft (VHF/UHF) is just as illegal in the UK as
>listening to the Police, Fire, Ambulance, Cellular etc etc.

>Airband listening is a very popular part of the "scene" here in the UK-
>visit any airfield civil or military especially somewhere like Heathrow
>or Mildenhall/Lakenheath and you will see an array of mag mount
>antennas that would do any inteligence (sp?) site proud.

Having listened to aircraft here in Canada, I can't imagine what the pilots or controllers are saying that they would consider private. I'm sure they don't care if people with scanners here them say "...roger, reducing speed to 200 knots."

>The Radio Communictions Agency produce a A4 information sheet on the use
>of scanners (Form RA169, phone number +(0)171 215 2150). The reverse
>side of which has the following "Questions and answers":-

>Isn't this a bit heavy handed ?
> No, no one likes their private conversations to be listened in to.
> Parliament has passed the laws in question to protect the privacy of
> radio users.
>

>At the end of the day though providing you act "normally" (whatever that
>may be) and don't go around chasing after Police Cars or similar there
>is more channce of you Winning the National Lottery than being in
>trouble for using your scanner.

Considering that it is virtually impossible to inforce a no-listening law of this sort then the privacy of radio users is hardly being protected.

In Canada, the radio laws seem somewhat more realistic. It's not illegal to monitor any frequency here, as long as you don't divulge information that you may hear or use it to your advantage. That way the law is aimed at abusers of the system, such as criminals using a scanner to evade police, not the otherwise law abiding citizen.

If you use a radio, it's like yelling in the park - anybody could hear you. If you absolutely need privacy then use a scrambler. One shouldn't rely on

government laws to provide you with private conversations on the air because they won't.

5447. AR8000 leather cases on www

Newsgroup: rec.radio.scanner
Date: 1995-06-23 00:00:00 UTC
From: Mike Baranowski <mhb@netcom.com>
Message-ID: <mhbDAM0I2.4ux@netcom.com>
Source record: 253639

I received my leather case for my AOR AR8000 about a month ago from Javiation. The leather case is MUCH like the one for the Yupi 7100. I prefer it over the vinyl. I believe Jonathan is working on one with a plastic window.

I took pictures of both leather and vinyl cases for the Yupi 7100 and AOR AR8000. These are viewable via Javiations WWW page.... http://www.demon.co.uk/javiation/

For those in the US, I believe you can purchase all these cases from Design EQ in CA. There is more info on the above WWW page.

Just thought some of you would like to see the case...

From: bobszabo@ix.netcom.com
Message-ID: <3sdj5u$2h3@ixnews6.ix.netcom.com>
Source record: 253640

Would like to get a base scanner with the opto board for computer control. I have located a 2006 new and know of a 2035 used. Does anyone have knowledge of both of these? I know if you own one or the other you would say it is good because from what I do know they are both great scanners. BUT! Which is best?

It's true. You are hearing images.

> If any one has a reference as to how to convert these
>frequencies to cell channels I would appreciate the info.TTYL Roy.

The first IF of the Uniden/Bearcat BC760XLT is 10.85 MHz.
You are hearing the phone images 21.7 MHz higher (twice the
IF) than their actual frequency.

The BC760XLT has poor image rejection, especially in that range.
I used my BC760XLTs only with an indoor antenna.

> ... acquired a used Uniden Beracat 200XLT ...
> ... lower frequency renge is 66-88 MHz. ... could go down to 49 MHz.

It's common for the European version of a scanner to cover 68-88 MHz,
while its American counterpart covers 30-54 MHz. In Region 1 (Europe,
et.al.) 47-68 MHz are allocated to broadcasting, while 54-72 & 76-88 MHz
are broadcasting in Region 2 (the Americas).
I wouldn't be suprised if there's a simple mod (cut a jumper, break a
diode) to restore the 30-54 range in your scanner. If so, reception might
be poor, as the front end is tuned for the other range.

If there really are, could you give me the exact address? Ive done long searches, only find that they (the mods for the pro-46) are only for the cell restore.

Also, on the cell restore, i see sometimes that it mentions the freq rang of the pro-46 to go to like 1100mhz? Mine only hits up to 959.0000 or so..
Can someone explain this to me?

>over seas. Will someone with experience
>please answer the following for me?
>
>1. Are their prices competitive?

Usually, depending on the exchange rates (yen-pound and dollar-pound). In many cases it's irrelevant since Jonathan has also been selling rigs that simply aren't marketed in the US (like the Yupiteru line) so there is no basis for comparison.

>2. Is the shipping duty ever charged and is it alot?

If you mean shipping COST ... that's included in the price.
If you mean CUSTOMS duty, you probably will be hit for 6% of the declared value.

>3. How are they when it comes to service?

Fast, friendly, reliable, reputable, knowledgeable, etc.

Jonathan Clough is a fellow hobbyist, and a true gentleman to boot. Also a friend. Dealing with him over the last few years has been one of the more rewarding and pleasureable parts of shopping for toys.

>4. Are there any problems dealing with an overseas vendor?

None whatsoever .... although you'll get things going faster if you deal with him by phone, and that means calling at odd hours to get the best phone rates to UK.

>5. Do they ship the unblocked versions of radios?

They generally ship radios configured for sale in UK. This means no lockouts of frequencies commonly restricted on US models. But the inter-channel steps may be different in some frequency ranges than those assigned in the US. On programmable sets like the AR8000 this is only a minor annoyance, and easily overcome.

>of solder on one of the SMCs?

Get a roll of desoldering braid. Park the edge near each solder tab and
heat it up. Keep cutting back the braid as it gets saturated, and repeat.
Soon enough you'll remove enough solder that the tab lifts off.

On 22 Jun 95 06:46pm, THE BLACK GRIFFIN wrote to ALL:

>>Here in Las Vegas, I hear cell conversations up to 912 (the top range
>>of my scanner). These are not images or cordless phones. I read that
>>the phone companies are having to expand the cell range due to an
>>increase in demand (due to lower costs and heavy marketing).

TB> Hmm.. well, I've been trying to see how broad the range is in this area,
TB> but I've picked up confirmed cell activity as low as 894.xxxx (can't
TB> remember).. havn't figured out an upper limit yet, only been doing it
TB> for a few days. But there's no doubt in my mind that they are cell
TB> phones.

The cellular phone bands are:
input (phone side): 825.03 - 834.99
835.02 - 849.96

output 870.03 - 879.99
880.02 - 894.96
except: there's been some minor changes I don't have the figures for;
anybody fill us in?
Basically, if you are hearing cell calls out of these bands (especially FAR
out, like in 900 MHz), you are hearing images.

TB> As for the person earlier asking about
cordless scrambling... the
TB> headset encodes the signal, beams it to the base which decodes it and
TB> sends it over the phone lines. Fairly simple actually.

Except that the base also encodes the signal to the headset. Otherwise, only
half the conversation would be encoded, and the stronger on (the one we
NEVER listen to), wouldn't be encoded.

I have no doubt that you can receive cellular CALLS at these frequencies.
However, you are not listening to cellular FREQUENCIES, so what you hear
must be images. Quality of the signal means nothing here. What is meaningful
is that you are NOT on the cellular frequencies.
If you take your final IF frequency, multiply it by 2, and subtract this
from the frequencies you are hearing the calls on, you will have the
approximate frequency they are REALLY on.

These "tests" prove nothing, really. You need a spectrum analyzer to see if
there really is a signal there. While the PRO-43, being triple conversion,
is almost immune to images, it's not quite image-proof. The fact that it
purports to pick up a signal at any given frequency simply doesn't mean that
signal is actually there.
Since the cellular frequencies are fairly well known, if you are receiving
cellular calls outside these bands, you are receiving images or
intermodulation. Not too hard to figure out.

Since you obviously are going to computer-control the scanner, the 2006 is best, because it's a little better at defeating intermod and images. The other differences don't count, as computer control levels the field. IMO.

Message-ID: <3sds6u$h66@diable.upc.es>
Source record: 253755

I have recently acquired a used Uniden Beracat 200XLT in
fairly new condition. Hoever, I would like some help
regarding the floowing items:

1.- The lower frequency renge is 66-88 MHz. It is not
fault on the unit because the manual also says this.
I thought it could go down to 49 MHz.
Anybody have any idea on this? I live in Europe, so
maybe it affects all european UBC scanners.
Any suggestions on how to get down?

2.- Does anybody have a list of key combinations when
the unit is turned on to perform additional functions?
I have seen these lists for other Bearcat Units.

I would really appreciate this information because scanning is
not as popular here as in the US, so there is much more less
information

Thanks,.

Date: 1995-06-23 00:00:00 UTC
From: campagna@q.continuum.net
Message-ID: <campagna.2.000ABCE3@q.continuum.net>
Source record: 253761

Does anyone know the VHF/UHF radio frequencies and their
respective channel designations as used by the Connecticut FBI ?
Please e-mail me at
campagna@q.continuum.net.
Thanks in advance.

The easiest way; do it upside-down. No chance of making a mess.
This way, you dont have to worry bout dropping lead (which I am good enough
that I usually dont anyhow) which is possible. And, you also spend less
time with heat near the IC's because the shield tends to fall the instant
the solder is melted.

Mark

I just heated it enough, lifted up the corner gently with needle nose pliers, and held it up until the solder cooled.

5478. Opto Scout Range?

Newsgroup: rec.radio.scanner
Date: 1995-06-23 00:00:00 UTC
From: gjosol@cris.com
Message-ID: <3seqcg$l44@warp.cris.com>
Source record: 253767

Hello Fellow Scout Users!

I was wondering if anyone would like to trade there findings as to the reception capabilities of there Scout Info interested in:

a. Transmitter Frequency and Decription (if known)
b. Approx. Distance (if known)
c. Type of Antenna Used

example:

a. 49.9 MHz - baby monitor
b. 1 to 2 ft range.
c. Opto's DB32 mini antenna.

I'm planning on trying an assortment of antennas to see which is the optimum performer per desired frequency range. Any thoughts?

ps. an article was wriiten about this very subject a few months ago in some magazine, unfortunately I can't recall which magazine.

5479. Re: Hint for 46 Mhz reception on hand held scanners.

>else noticed an improvement in e high bands with the telescoping one?
>

Yes, It seems to me (on a Pro-34 & Pro-43) that it picks up NOAA WX radio
16x.xxxMHz, 2m ham, 144-148MHz, police & business, 15x.xxxMHz better than
the ducky. Also the duckie for the Pro-34 (made by GRE I think) is
better than the one for the Pro-43. Listen to a station in this range
with the antenna fully extended, then lower the section that is immediately
above the coil down into the coil and you should hear a noticeable
improvement. With the antenna adjusted as directed it does better than
the duckie from 30-170MHz. I haven't noticed any improvement above about
170MHz.

Happy scanning!

When I got mine it already had the cell mod done to it!!! :-)
So I didn't have to remove the shield. I did the audio mod and
didn't have to remove the shield that is above the processor
because the audio mod involved the board above the logic
board (the logic board is the one with the processor & diodes for cell
restoration). If you need any more help let me know. I thought the
audio mod was worth the time but I also replaced the speaker at the same
time so maybe that made the difference.

Drops frequencies by 400 mHz, designed for 800 mHz reception.
(872.000 would be received as 472.000)

Saw a message a few weeks ago... here's a little more info.

Ramsey Electronics in Victor, New York Phone: 716-924-4560
Kit 4u2 assemble: $40
Little black box for the assembly to be placed in: $15
Assembled kit (already in the little black box): $90
10-day return policy in like new condition
(even for the kits if you do nothing but drool on them)

Grove Enterprises Phone: 800-438-8155

Little black box known as the GRE 9001: $86 plus S&H
30-day money back if ya don't like it (like new condition)

Let me know what you think if you try either of the produx.

I did it with a regular 30-watt iron and some braid. It was pretty
simple. Doing the cell mod with the aforementioned iron, though, was
pretty hairy.

I'm comparing the MVT7100 and the AR8000, to buy one. The 8000 seems to be computer configurable for all sorts of things, including adjustment of arbitrary frequency coverage limits, and other modes, and stuff.

I'm also looking for USB and LSB demodulation, rather than dual-sideband. Do either of these do it? What's the difference between BFO and any other scheme to recover sideband?

I hope to use it for audio stuff (ham bands), but also fax and digital mode reception.

Many people have asked about this...

Apparently EDCO does not yet provide the DS8000; I'm not sure if they plan to provide a limited version of the DS8000 (something like their limited version of the computer interface).

A few days ago, through a lead from our European office in the Baltic States, we received our first case shipment of AOR DS8000 descrambler units. These are the full-featured official DS8000 units made by AOR for the AR8000 receiver. The DS8000 descrambles tone/speech inversion scrambling.

The DS8000 simply plugs into the option board connector intended for this purpose inside the AR8000 and its operation is fully integrated into the AR8000. Besides accessing the option board via the SC and SI computer interface commands, it is also accessed via the LOCAL key on the AR8000 keypad and the DIAL knob on top of the receiver.

All the best!

Antennas, Filters, and preamps are the key. If you know someone is transmitting on a particular band, then you will get an easier reading if you bring the rf floor down by using a filter - opto and startek both sell them. Their cell band filter/amplifier works great. I haven't tried their adujustable pre selector, supposedly excellent - should be for $1k. Antenna wise I use the DB32 only when necessary to keep th scout lowkey, otherwise the max800 is great for 800-900, and and I ether use a telescopic or a anli all band rd the rest of the time.

My experience with Javiation was VERY positive. I dealt with Johathan
through his Email and never had to call by phone. He was very helpful
and polite and I would deal with him again by all means.
One example of the service:
I ordered the AOR computer interface for the 8000 by Email. After a
week or so it didn't come so I sent more Email. Jonathan answered me
promptly and admitted to me that he had read my email but then forgot to
process my order. Easy enough to do....
Jonathan made apology to me and picked up the tab for 2nd day shipping.
My order was double boxed to and everything worked fine and I love my
8000.

<SNIP>

Well, I seem to remember that the new ECPA laws not only make cellular listening illegal, but make it illegal to manufacture new downconverters. However, my question is, does the ECPA prohibit the manufacture of upconvertors? (I.E. convert 800-1000 to 1000-1200) Many of the newer non-cell capable scanners cover this frequency range, and it would seem to be just as easy to build. Thanks.

Oh, also, anyone know if a BC2500XLT with a date code of OGID can be modified? I love the scanner, and can pick up cell images just fine, but was hoping for actual direct frequency readout.

-Zeet

" >I'm planning on trying an assortment of antennas to see which is the
" >optimum performer per desired frequency range. Any thoughts?

I was decidedly UNimpressed with the first days capture with the Scout 400.
Similar results as the poster.

Cordless phones - about 2 feet with a 48" telescopic whip.
Cell phone - about 3 feet.
Cell site relay - zip, zero, nada at 20 feet.
Police UHF HT - nothing at 40 feet.
147 Mhz. at 5 watts - capture at 50 feet
147 Mhz. at 1 watt - capture at 30 feet.

I'll need to experiment with other antennas also within the next 30 days
before I'll decide whether to return it or not...

I'd like to hear about the success of other users also.

Ken

>I have
even scanned my own calls as a test
<

Interesting. I am curious about these cellular phones. I have been trying
to understand all this stuff, but quite frankly it is difficult. I do have
two questions that will really help me understand if somebody has the time
to explain.

1) IF you just happen to be receiving a particular signal, and then it all of

sudden changes to another channel, what happens? I know that sometimes, if
that particular cellular phone is moving, that you may loose the signal as
it changes to a different tower (is this even correct?). But what about when
that phone is obviously stationary?

2) Does a cell phone only transmit on one frequency? Or does it change randomly,
or can it be manually changed like on a cordless phone?

Thanks for the time,
Drew

Had it right the first time. With the introduction of the digital celluar phones, the control signals are done in a burst fashion with a 5k and 10k rider on freq.

>>very good...

As far as I can guesstimate with the freqs, these are the extended cellular freqs on top of the original 666 channels.
>
>Using my Motorola DPC and my Pro-43, I did a bit of testing as well.
>Frequencies such as 903.375 MHz would pick up the call, but then drop

This due to the rotating of the channels at the cell site and the various signal strengths from each cellular phone within each cell site's signal radius.

5503. AZ State Land and BLM frequencies

Newsgroup: rec.radio.scanner
Date: 1995-06-24 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DAp1EK.6F7@ennews.eas.asu.edu>
Source record: 253492

I'm distributing this article only to Arizona, as I assume not many other people would be able to answer my question.

I am looking for State Land Fire channel 3's frequency. I have channel 1 (151.400) and channel 2 (151.415). It's not listed in "Police Call".

I'm also looking for command/tactical frequencies used by BLM in this area. I have their Phoenix dispatch freq (168.300), but that seems to carry very little, if any, tactical/command traffic. I know there are a lot of frequencies for BLM and BIFC in the Police Call book, but I don't have enough spare channels to just program them all and wait to hear something. I'm sure someone out there actually listens to these agencies, and knows what's in use and what's not.

If anyone out there knows these frequencies, please e-mail me. Thanks.

>received into a stream of data.

Assuming the audio is Frewuency Shift Keyed (FSK) binary data,

you could use an Op-Amp to adjust the freq input to the appropriate

RS-232 levels and shape the square wave at the same time.

horak@convex.com (David Horak) writes:

> $175 is quite a bit for this old, slow scanner.
> David

Well, since I had the thing basically sold the same day I posted it I guess David's opinion must be wrong.... Particularly when the buyer called and made sure he tied it up by offering $200, and cashing out that evening....

....so, my business partner heard mine, when I got it a few years back, and begged for the "modification" to broaden the range to include the cell band. He'd like to also sell his Pro-34....

Radio Shack Pro-34 hand held scanner $200

Like new, fast enough for anyone (except David), 200 programmable channels... AC power supply.... Preference given to Portland Oregon buyer....

e-mail raylc@teleport.com
or call (503) 254 3484 (this weekend only)

Thanks,

Ray

> rwilkes@freenet.edmonton.ab.ca

Sorry Roy but the Bearcat 760 is quite prone to images. The cellular
band runs from 868-894 Mhz (or close). Subtract 2x the IF freq of
the 760 and you'll get the true frequency of the call.

Sure, you can get shortwave on a scanner. I have an AOR-1000 and listen
to SW broadcasts on it all the time. When I listen to the SW broadcasts,
I use a longer antenna, either a telescopic antenna or a length of wire.
The AOR-1000 will also listen to local police.fire, and aircraft
frequencies as well as cellular phone frequencies JOHN

Z> downconverters. However, my question is, does the ECPA prohibit the
Z> manufacture of upconvertors? (I.E. convert 800-1000 to 1000-1200) Many
Z> of the newer non-cell capable scanners cover this frequency range, and
Z> it would seem to be just as easy to build. Thanks.

The FCC rules make it illegal to import or manufacture frequency converters
for the cell bands, not "downconverters".
47 CFR Ch.1, part15.121 reads, in part,
"(a) Except as provided.... scanning receivers and frequency
converters designed or marketed for use with scanning receivers, must
be incapable of operating (tuning), or readily being altered by the
user to operate, within the frequency bands allocated to the Domestic
Public Cellular Radio Telecommunications Service..."
This applies to all frequency converters, not just downconverters.

I've had my scout for a week now, and must say that i am impressed with it.

100 milliwatt Transmitter @ 140 MHz 40 + Feet
50 milliwatt Transmitter @ 398 Mhz 40 - 50 Feet
Cellular Phones - Several ranging from over 30 ft to ??????
Business Band - 462 - 465 Mhz from ???????
AIRCRAFT!!! (Didn't know this worked, but I've received mre than a few in the 119- 127 Mhz range from high above.
154 Mhz Police Band - From an unvisible distance away

I'm using the Grove Ant 8 48 inch whip antenna. It collapses to about 8 inches.

I carry it on my belt, and when I'm in the car if i can put the top down, i place it in the passenger seat. While i drive around I seem to always pick up signals I didn't know existed. I just got my ar8000 and am going to miodify it for reaction tuning.
I did not purchase the mini antenna from Opto when I got the unit. it just can't possibly do what the ant - 8 does.

Source record: 253669

Hi

I have a Radio Shack CTR76 Voice Activated tape recorder.
This unit only has a microphone input jack. Is there any
mod to convert the microphone jack into an auxiliary input
so I can run a patch cord to take the output from my
scanner and input it to the CTR76.

Also, once the CTR76 is activated, it continues to run for
about 10 seconds after the scanner goes silent. Is there
any way to reduce this lag time to perhaps 1 or 2 seconds?

Ken, I know what you mean, I was under the impression that the Opto
Scout by itself without the aid of a pre-selector or any amplifier
would be able to "Capture" most frequencies at fair distance. Past 100
feet would have been nice <g>

The Counter is accurate, I've compared it to several HP counters w/ a
stable synthesized source (HP8657) and the results were comparable.
I guess that's enough for me to keep mine, since that was my original
intention to get an accurate counter. (a little expensive though).

If anyone knows of ways to get more receiving range out of the scout
whether it be pre-amplifier, antenna type etc. please post publically.

Thanks, george-

Jeff said just a couple of days ago that his store has them in stock:

The Ham Station, 220 N. Fulton Ave., Evansville, IN
47719-0522. Telephone (800)729-4373, (812)422-0231.

That's where I bought my BC3000XLT and extra battery a few
months back.

Yes I own a 900mhz scrambled phone. Its digital and when you pop the
freqs into a scanner they sound like:white noise,hash or open squelch.
It works VERY well and I have GREAT range. It's not hype,try one!

I presume you mean I-90 to Rochester from I-81
The NYS Troopers Troop 'T' cover the thruway and use a repeater system
The repeaters have two outputs: 453.425 and 453.525
The outputs alternate between repeaters. So once you drive out of range
of the one, switch to other frequency. You will be able to hear just
about all of the units between Rochester and Syracuse because I beleive
that is all one 'zone' As an added bonus you will hear a roll call on the
hour that gives temp/road conditions at each exit, and this you will hear
for every exit on the Thruway.

Q> I was in a Rat Shack the other day and was looking at the scanners. All
Q> they had were the new ones, that the sales droid said didn't get
Q> cellular and weren't modifiable. I know the part about no cell freqs.
Q> is true, but can it be modified to get them? Are they (m)any mods out
Q> there to do other things (like expanded channel capacity)?

The FCC says that these scanners "must be incapable of operating (tuning),
or readily being altered by the user to operate" on the cellular bands.
Manufacturers have taken this to mean, "can't be altered", so they make them
that way.
As for the other mods, there are hundreds. They range from simple, 'snip
this part' mods, to much more complicated mods, like adding more memory
channels. In between, there are mods like adding a LED to indicate the
squelch has broken, or an S-Meter, or a center-tune meter.
You might try buying one of Bill Cheek's books to get a better idea of
what's possible.

S> does anyone know how to convert a scanner to a transmitter?

Sure. Duct-tape the scanner to a transmitter. ;-)
The job would be as simple as building a transmitter, and putting it inside the scanner (in the battery compartment?), and using a switch to toggle between the two.
Are there such mods being done? I sincerely doubt it. Unless you are very skilled at this, you couldn't begin to do the job as well as has been done in commercial HT's.
Is this what you meant?

Don't worry. A lot of smaller departments, like my local PD, don't have the money to purchase expensive digital radios (mobiles, hts and base radios), especially when the officers are below the poverty line. Some of the larger, well funded PDs may switch over to digital, but analog is going to be still going to be used for a while to come.

I recently brought the scout, I just want to say if anybody is thinking of buying one buy it. This as great little freg count. I live in NYC and I go to central park on the week end, with the scout I pick all kinds of freqs. Park police, park ems, yes cellular phones. I checked, it is ok to pick up the freqs of cell phone but by law you can not listen to it. But who is out there checking anyway . I seen a women sitting about 15 to 25 feet away from me, and she starts to use her cell phone, and bingo my scout picks up the freq she is using. I guess if I had a scanner that could pick up the cell band I could hear what she is talking about.

Great toy.....

5549. Re: Picking up Cellular on 902.0 - 915.0 ?

From: jlsny@nyc.pipeline.com
Message-ID: <3sl8ps$3sf@pipe1.nyc.pipeline.com>
Source record: 253518

Cell phones comes in two set of frequency,

1) 825.030 to 844.980 These frequency are what the portables,
and car phone use to communcate with
the cellular system. If you pick up
anything in this range it means the person
using the cell phone is close to you, since
the cell phones can only put out about 3
to 5 watts by law. Most of the time you
only hear one side of conversation.

2) 870.030 to 889.980 These are the frequency of the cell sites,
They are big repeater system located
everywhere. Listening in this range you
can hear both side of the conversation
and a greater distance away because
the repeaters put out about 100 to 150
watts.

This is for information purpose only.

5550. Help with PRO-2004 CPU

Newsgroup: rec.radio.scanner

From: jdg@devine.ColumbiaSC.NCR.COM
Message-ID: <DApLE6.Fvv@ncrcae.ColumbiaSC.ATTGIS.COM>
Source record: 253519

I am the sad owner of a Radio Shack PRO-2004 that unfortunately has lost its mind. (The scanner, not me!) I have the service manual and have pretty much narrowed the problem down to a bad CPU. A call to one local Radio Shack revealed that the part is no longer available. I plan to call another store to make sure.

Anyway, I really like this scanner. It is the predecessor to the PRO-2006. Its EL LCD backlight has just about quit, but I can live with a dim display. Does anyone have a suggestion on finding a source for a replacement processor? The CPU is a GRE-0327, obviously a custom programmed processor. Anyone know who made this chip? It is possible that the PRO-2006 also used the same CPU since most of the PRO-2004 to PRO-2006 changes were cosmetic.

Just bought a store demonstrator BC700A, as a starter unit. It came without most everything (no manual, power cube, etc.), just scanner and antenna. I've figured out just about everything so far, even how to program a frequency into a memory group, BUT I can't figure out how to get it to scan _only_ the memory channels.

Until I can get in touch with Uniden for a manual, could some kind soul help me figure it out?

If you are uncomfortable, consider this:
Either at your local library or magazine store get copies of
73
CQ
or QST
Each lists HAMFESTS that are in your area. A hamfest is a swapmeet,
tailgate gathering or flea market where radio equipment, computer stuff,
scanners and other goodies are sold and sometimes traded. If you know
what you want, bring cash and batteries.
In my opinion, goods are sold at 1/3 retail. Not bad, if you can try the
stuff out before you buy, or you demo what you want to sell. I've found
some neat stuff this way, and sold what I didn'need.

Just a thought......

I believe that one is safer on usenet. At hamfests, you don't usually see
the seller again. In fact, knowing this, a seller won't mind sticking you
with defective goods.

With the one to one relationship, including usually a phone number, I find
that people are much more honest. I have bought and sold more than 10 items
this way and am much more pleased than through a hamfest.

I've bought 3 items and sold three on radio.swap. All deals
went perfectly and all equipment was exactly as advertisized.
That doesn't mean there aren't problems, I just haven't had
any. Standard procedure...buyer sends certified payment, then
sender sends equipment. Second choice = COD.

I've sold three scanners in the past year. In one instance, the buyer sent me a money order; in an other, the buyer sent me a personal check; and in the third instance, the buyer requested COD. The first two buyers showed great faith, in my opinion, for sending a complete stranger hundreds of dollars for something they've never seen before. Lucky for my buyers, what they got were scanners that were exactly as a described them (mint). I'm not so sure that I would be so trusting.

Perhaps if two people (strangers) have done business and were happy with the results, they might consider acting as references for the other person. Over a period of time, they would build up a pretty good network. Just a thought.

I've bought lots of stuff sight unseen from people I'd never met for years. To avoid being ripped off:

If possible, pay with a major credit card. You have recourse through the credit card issuer if things are not as expected.

When dealing with an individual, always pay with a U.S. Postal Money Order available for .85 at any post office. These are cashable at any post office as well. The Post Office keeps all the cashed money orders for years and can provide a copy of both sides if necessary. Also, if you use a P.M.O. you have recourse through the Postal Inspection Service if you don't get what you paid for.

It also never hurts to ask the seller if he has sold other stuff to folks on the Net and if so their names and addresses. Contact them and ask if they were happy with their purchase, was it shipped promptly and was it properly packed for shipment.

If you use a little common sense and follow the above policies you should do just fine.

Brand new Uniden Bearcat Turbo Sportcat handheld scanner with
auxiliary lighter power cord. Problem: keys too small and the
display too small for easy reading at this stage in life. Need a
good shortwave receiver with battery capability and lcd display.
Will trade scanner plus cash for a good s/w receiver. I use this
with scouts and they have turned out to be more interested in
countries reception than what a scanner can bring in.
And, with hand arthritis, etc., this is just too small a unit
so I am willing to trade for something we can use. Thanks. Please
email as I check in daily. RETUR@UNO.EDU

Can anyone tell me how I can decode paging company transmissions?

I am looking for some form of interface to go between a receiver's audio output and a PC with appropriate software.

I know there are many commercially available decoders but I would like to build my own simple unit just for POCSAG transmissions.

I guess the most important info I need is how to convert the auddio received into a stream of data.

Tim.

Yep, that's about it! I have a Maritime Radio Licence Licence (restricted) for VHF use AT SEA and technically I can't listen to a weather forecast broadcast by the coastguard while ashore!

5571. Percon Spectrum CD and MS Access

Newsgroup: rec.radio.scanner
Date: 1995-06-26 00:00:00 UTC
From: jmmorrison@aol.com
Message-ID: <3smgb9$s1r@newsbf02.news.aol.com>
Source record: 253540

Has anyone tried extracting data from the Spring, 95 Percon Spectrum CD using MS Access v1.0?

So far Access and my cd-rom drive has been running for almost two days straight and is only 35% done. Naturally at this rate it's going to be a while still. I've attached the Spectrum .dbf file as a table. Using this table I've written a query using the '*' to select all fields and state using a criteria of "MI" for Michigan. This query is a make table query. I'm using a macro to run the query and also have a "setwarnings" command set to "no".

Sounds simple enough to me, but it just seems as though it should be running a bit quicker. I'd appreciate input from someone who has tried using Access to extract out specific data such as I am.

Thanks,
John M Morrison, Detroit, MI

5572. Opto Scout Range

Newsgroup: rec.radio.scanner
Date: 1995-06-26 00:00:00 UTC
From: footage@panix.com
Message-ID: <3smign$dv5@panix.com>
Source record: 253541

I've had a Scout for about 2 months. In areas of high ambient RF you can't expect as much accurate capture as in areas with a lower RF level. For instance, in the heart of mid-Manhattan the Scout's capture algorithm can't pick discrete signals out of the hash, but along California suburban California freeways all sorts of good hits come up. In rural areas with the little stub antenna you can capture cell sites (and, more often, paging transmitters) from 1000 feet away; in NYC 100 feet can be too far. Inside buildings can be great for capturing in-house signals if the building itself shields against outside RF; try your Scout at indoor events in steel buildings and you will be pleasantly surprised.

In urban areas most of my hits tend to be SMR inputs, 3W cellphones, paging xmtrs and notorious open carriers (data links, etc.)

Also, don't trust everything you see on your Scout. I doubt the aero freqs are good hits. Lots of bogus 100-200 mHz hits show up on mine.

I like the unit. I'd recommend it for whoever has the $$$ to drop on something without a speaker.

For sale a VERY little used APS -104 preselector. Made by Optoelectronics to increase the range of their nearfield devices by ten times. I paid $995.00 plus tax and shipping. The first "real" offer of $600.00 takes it. I pay shipping. It is brand new in box with instructions.

In Alberta, (and I believe British Columbia as well), there is a book called "The Alberta (?BC) Frequency List". It costs about $20 and details are listed by location, frequency and user.I have seen them for sale in my local RS. It is a "must have" for scanner enthusiasts here. BTW, I have no connection with the publisher/author. I hope this helps.

I did the same thing with the Fall '94 CD and Access. I attached the file as a dbase IV table and selected all fields from the table and used a make table query for all records with State equal to "Al". It took about an hour and a half using a 386 DX 40 with 8MB of RAM.

It does take a while, so be patient.

The bogus hits tend to congregate in different frequency ranges depending
on the antenna you use. Once you know the resonant ranges of the
particular antenna, it becomes easy to throw away the red herrings.

> sound card? I am thinking of writing one that may handle frequencies up
> to 6kHz. IT would list all strong frequencies in a given signal over a
> set noise threshold.

It already exists as a commercial product. Actually, there
are three products for the MS-Windows environment, all of
which give you:

Time-series display
Spectrum display
3-D surface display
Color spectrogram display.
Maximum rate = 44kHz
FFT sizes = 128, 256, 512, 1024 or 2048 points, user selectable.
Update speed = >15/second with 1024-point FFT on 486-50
Peak Tracking (Maximum amplitude frequency continuously displayed)
Markers = Three user-defined frequency markers.
All displays are printable
Many more features that I am too lazy to type in right now.
Requires: MS-Windows v3.1, 80386 or better, 2MB RAM, VGA or better,
Windows-compatible 8 or 16-bit sound card, Mouse & Math
co-processor recommended.

The three different versions give you increasing capabilities:

1) Spectra Vision ($89): All of the above, but no record or playback.

2) Spectra Plus v2.0 ($179): All of the above, plus Record,
Playback and post-process from WAV files.

3) Spectra Pro (aka Sprctra Plus v3.0) ($395). Additional
features. They are sending me the information on them
and I will post it when I receive it.

This software is available from:

Pioneer Hill Software
24460 Mason Road
Poulsbo, WA 98370

800-401-3472 (voice)
206-697-3472 (voice/FAX)

I have not used this software, but am just quoting the
information from a two year old brochure. I did verify
the prices this morning, however.

> What are the descrambling options via the Dial knob ?

The DIAL knob on the AR8000 can be used to adjust the beat tone for
the best sound on the optional DS8000 Descrambler board.

Many have inquired about the DS8000... I'll post an overview of
installation and operation in a moment.

All the best!

But be warned that transmitting sucks power, so also watch the other
Gilligan's Island episode where the Professor recharges the radio's
batteries using coconuts.

5594. SWAP: Excellent cond PRO-2035 for BC-9000XLT

Newsgroup: rec.radio.scanner
Date: 1995-06-26 00:00:00 UTC
From: batwing@digital.net
Message-ID: <3snhe9$1qq@ddi2.digital.net>
Source record: 253563

I have used my new PRO-2035 for about a week now, and I am impressed, but I would also like to try the BC-9000XLT. I figure this is about an even swap.

Email, thanks.

Doug

5595. I'm afraid to use the back light on my 2006! Should I be?

Newsgroup: rec.radio.scanner
Date: 1995-06-26 00:00:00 UTC
From: bobszabo@ix.netcom.com
Message-ID: <3snflp$1su@ixnews5.ix.netcom.com>
Source record: 253564

I have been reading that the display on the 2006 will go dim in time. How long will it take for this to happen? I just bought a new 2006 and have been using the light very sparingly and would like to use it more often. Any advice?

Bob Szabo

5596. Prez is in town...Need SS frequencies

Newsgroup: rec.radio.scanner

Cross-posted to: rec.radio.scanner,alt.radio.scanner

We've had quite a few requests for more information about the shipment of AOR DS8000 Tone/Speech Inversion Descramblers that we received last week. Here is a quick overview of the instructions for installation and operation...

TO INSTALL THE AOR DS8000...
o Open the case of the AR8000 by removing four screws (two in the battery compartment, and one on each side above the rubber sidewall).
o Remove the jumper pin at the connector on the upper part of the circuit board.
o Plug the DS8000 into the connector.
o Reassemble the AR8000 case by replacing the four screws.
o Initialize the DS8000 by holding down the LOCAL key while powering up the AR8000.

TO OPERATE THE AOR DS8000...
o Enable/disable DS8000 descrambling by pressing the AR8000 LOCAL key.
o You can also access option board via the SC and SI computer commands.

TO ADJUST THE AOR DS8000...
o You can adjust the beat tone for the best sound by holding down the AR8000 LOCAL key and turning the DIAL knob (the descrambling indicator on the AR8000 LCD display will change).

All the best!

5603. Help me use my voice activated recorder...

Newsgroup: rec.radio.scanner
Date: 1995-06-26 00:00:00 UTC
From: dube@u.washington.edu
Message-ID: <3sndtm$6r5@nntp4.u.washington.edu>
Source record: 253572

I have a tape recorder with VAS (voice activated system) which should be great for taping all night, but there's a problem. I'm using a Uniden Bearcat 8500-XLT and when I plug the connector for the tape recorder into the headphone jack on the scanner, apparently there is just enough of an electronic hum to keep the tape recorder moving, even if it is just scanning and is not fixed on an active frequency.

First, why would it do this? Second, is this common at all, or just on certain types of scanners? Third, is there anything I can do about it?

Thanks for your help.

Hi there...

Well, you bought it for its features right? Why not use them? I've read things telling one not to keep the light on because of possible burnout but why would they put it in there if it wasn't going to last? Well...nevermind about that. Keep that light on if it lets you read the display better, you've paid for it!! I've had my Pro-2006 for about 3 years now and I use my light A LOT and its just as good as when I bought it.

My $.02

Andy

Source record: 253575

What kind of recorder do you use for the scanner recordings? I am using one of the GE microcassette recorders with VOX which works adequately fine. The only problem is even with the slow speed, I can record only 1 hour worth of recording on 30 min. tape. Also the recording is not of great fidelity.

I am looking for the affordable one which should record automatically on the both sides (auto reverse) and with VOX capability. Any recommendation on models which I can afford (below $100)?

Thanks for your advance consideration.

Someone (Ken) pointed out that Radio Shack has an 800 number for parts and service. I called this morning and ordered the CPU for $25. It pays to double check. The person I spoke to at the 800 number was surprised that a local store had told me it was no longer available. The store sales person also told me he knew of no number to call to get replacement parts, and that all requests HAD to go through a retail store.

Soon to be happy again PRO-2004 owner,

Jim Griggers jdg@devine.columbiasc.attgis.com

From: slush@VOA.GOV
Message-ID: <DAsnr1.4qz@VOA.GOV>
Source record: 253578

In article <DA6zsG.31u@cs.dal.ca> af898@ccn.cs.dal.ca (Danny Colquhoun) wrote:
>Any suggestions or tips concerning recording transmissions using a voice
>operated recorder?

If you're thinking about using a patch cord between scanner and recorder...
as far as the microphone input of a tape recorder is concerned,
the audio output level of a scanner [or normal radio, or TV, or whatever]
is so much too loud that the expected result is distortion. You could
always turn the scanner volume WAY down as compared to normal listening
level, but you still might end up with a recording of distorted audio.

If you're thinking about relying on an internal microphone on a recorder
with voice-operated capability and just placing the recorder at the
scanner's speaker, you might record noises from the vicinity of the
recorder -- such as vehicle traffic, telephone ringing, people talking
in or near the same room, etc.

The best way to record scanner audio is to use a recorder which has a
LINE-level input, and connect to that instead of microphone-level input.
If your recorder does not have a line-level input, you'll have to use the
microphone-level input. And to help with that, Radio Shack [at least
here in the U.S. -- I don't know about your Canada location] sells a
patch cord with 1/8" [mini-headphone-sized] connectors on each end and
an audio-reducing pad built into it [roughly 50dB]. Using this type of
reducing patch cord, connect one end to the tape or earphone output of
the scanner, and plug the other end into the microphone input jack of the
recorder. Set the scanner volume to normal level, and you'll record
great-sounding audio. Good listening!

H> Why do most standard scanners not cover CB frequencies??

Traditionally, scanners do not cover Shortwave, otherwise known as High Frequency, or HF.
Traditionally, HF ends at 30 MHz, and CB is down around 27 MHz.
There's no real hard-and-fast reason, otherwise, and some scanners do cover CB (PRO-2004, -5, -6, for example). Of course, 'full coverage' scanners that cover HF will cover CB, too.
Hope this helps.

RD> First, why would it do this? Second, is this common at all, or just on
RD> certain types of scanners? Third, is there anything I can do about it?
RD> Thanks for your help.

First, many radios do this. It's easier (cheaper) to design an audio section
that isn't totally dead, just quiet. You can't hear what's being put out, so
they don't care.
Second, not all scanners are like this, but many are.
Radio Shack sells attenuated patch cords for just this purpose, and they
work well for me.

>alignment. Anyone have any suggestions or like experiences?

Yes, that's a common phenomena with R-7000. As the reference oscillator
crystal ages, it changes frequency. There's a variable slug tuned
coil located under a shielded partition on the side of the R-7000
used to tweak the oscillator back on frequency. It's a fairly
simple adjustment. The difficult part is finding the proper coil.
Make sure you use a proper alignment tool to avoid breaking the
core.

By all means, get a service manual. The schematic shows the coil,
but the symbol for the coil is in error as it doesn't show the coil
as tunable. A schematic is furnished with the R-7000 so you should
be able to find the coil without the full service manual.

I replaced the R7000 with an R7100 and no longer have the R7000
service manual.

The other reason that he couldn't get a signal is beacause a CATV system is designed only to carry braodcast signal & filter out all others. Yeah it would be great if CATV companies didn't filter out the 2-way radio spectrum, but then would you want to $14.95 a month so you could listen to your local frequencies?? Great idea, I made the same mistake 16 years ago in my early days working @ a CATV system. Better to goout & buy a quality moniroring antenna.

Good Luck

5630. BC9000XLT Questions/annoyances

Newsgroup: rec.radio.scanner
Date: 1995-06-27 00:00:00 UTC
From: bodoh@dakota.net
Message-ID: <3so2ln$4ev@westie.mid.net>
Source record: 253591

Hello,

I sold my PRO2004 recently and replaced it with a BC9000XLT assuming that I could use the audio out as I did with my 2004. I have a wire running from my scanner (in the living room) to an amplified speaker in the bedroom. With the 2004, I just left the radio on with the volume turned down at night. The AUX AUDIO output jack was set to a constant level, unaffected by the volume control. The 9000 does not work this way. The audio out (record) jack on the front is controlled by the volume control, so I have to leave the radio turned up at night. I realize that I could plug the amplified speaker into the speaker jack at night, cutting off the internal speaker - but I don't want to have to wear out the plug and jack all the time. There is also a phono jack on the back marked AUX - but I have been unable to get anything but hum from it. Anyone know how it is to be used, the impedence, etc? Any thoughts on a mod to render the audio jack on the front unaffected by the volume control?

Another minor annoyance is that you can't use a priority channel that is locked out. This sounds like a minor nit to pick, but that's how I got around the lack of WX key on my 2004. I just set a channel to the local NOAA WX station, set it as the priority channel and locked it out. Then my PRI key acted like a WX key! I would like to see Uniden change this in future models, or give me a WX key!

I really do like the radio - and see these as rather minor concerns. The text labels are real slick to have...

From: kjn@netcom.com
Message-ID: <kjnDAu80u.JAx@netcom.com>
Source record: 253592

Well folks, thought I let you know about my field test with the Scout with Ver 3.0 software. I started off by trying to capture the freqs of the PD unit that was dispatched a few houses down on a domestic violence call. With the 46" ANT-8 I never did get a lock on the freq finder even though I was within 60 feet of the officer while he was using his HT.

Next I wandered around the crowd in SF who were watching the President/Secret Service activites. The 46" antenna did allow a few hits of SS personnel but drew FAR too much attention. Any lesser antenna yielded 0 hits of agents 20 feet away who were using their radios.

A trip out to the San Jose airport yielded 0 hits even when parked next to the tower, strolling around the terminal, or next to the glass windows as a pilot on the other side sitting the cockpit was talking to ground control.

I tried using a preamp (no preselector) and didn't get any noticable benefit in any of the areas.

Hand held cell phones were captured only when I was within range of the voice of the caller. Beyond 15 feet - forget it. Transportables were a bit better. Capture out to about 20 - 25 feet.

Cordless phone handsets were undetectable unless the antennas were practically touching. The base station side was completely undetectable. Even when the antennas were touching... Useless for that application!

I planted a 200 mWatt wireless mic that transmitted on 180.2 Mhz.
I was able to detect it at 10 feet. The bargraph worked great to locate the transmitter.

5 watt VHF and UHF HTs in the ham bands were detectable out to about 60 feet depending on antenna phasing. If the 46" ANT-8 was polarized with the transmitter then 60 - 70 feet was the best range I experienced. Cut the transmit power to 1 watt and the distance was cut in half. If the Scout antenna was cross polarized with the transmitter the range was also halved.

As a test bench accesssory it was great. As a monitoring tool it was pretty much useless as it came out of the box. Maybe with an amp and preselector it performs better but there's VERY few of us who are willing to spend $1,500 - $1,600 for a frequency finder!

Thank GOD for the satisfaction guarrantee! UPS has the unit on its way back to Grove to be tested by their techs to see if something was wrong with the particular unit that I had been shipped. Some folks report MUCH better results. Unfortunately, the particular unit I received was a poor performer as a listening tool. Maybe the next generation will be better...

Here in the UK CB is FM and it has an unusuall freq step, most scanners dont cover that step.
Youd need a scanner with 1khz stepping to get CD here.

Also as said CB's are really cheap so....

I use my SVHS Video, it give upto 8hours of record time. BUT you have to record and then search for sound, so
its a lot of silence and a bit of air time really.

I doubt a longplay video is less than 100 though :(

Source record: 253597

Our newspaper is looking for any advice anyone has regarding scanning of 800 MHz trunked communications systems. Our emergency folks are switching over from a lower-frequency system and we need to be able to keep tabs on what's going on.

Any advice on what type of scanner to buy or any problems we might encounter would be much appreciated.

Please respond by e-mail to rsr@herald-sun.com

Thanks very much.

5638. Zapper - More Range

Newsgroup: rec.radio.scanner
Date: 1995-06-27 00:00:00 UTC
From: kjn@netcom.com
Message-ID: <kjnDAuIDz.C8o@netcom.com>
Source record: 253599

Following the thread RE: Zapper & its use I decided to build one. I obtained the kit from JDR Microdevices and completed assembly in about 1 hour. The range when completed was only about 1 car length even when peaked as instructed.

I soldered an additional 3" of antenna and the performance Zoooomed. Unfortunately trying to operate the unit with the new antenna sticking out the front was a pain. I relocated the circuit board from the front of the unit to just in front of the battery and folded the antenna into a => shape pointing forward. I potted the base of the antenna in epoxy for support.

When reassembled the unit tripped the radar detector at 126 yds. Nice improvement... I tested the unit with a Uniden, 4 band STALKER model LRD-9000W detector. Strangely enough, it registered as a Ka band radar gun rather than a K band radar. So much the better...

My neighborhood has been plagued with youthful speeders who think that radar detectors offer them a free pass. After placing the Zapper on a fence and powering it with a battery eliminator and a timer. I've noticed a unique slowing of traffic along my block in the afternoon when the unit is on.

Lets hear it for FCC part 19 and low power transmitters...

5642. RS PRO-51 currently on sale

Newsgroup: rec.radio.scanner
Date: 1995-06-27 00:00:00 UTC
From: ppicot@irus.rri.uwo.ca
Message-ID: <3sp7qc$gb6@falcon.ccs.uwo.ca>
Source record: 253603

For anyone who is interested, Radio Shack (Canada only?) is having a 'Red Tag' sale right now -- the ham HT sale has been extended, and some other toys have been put on sale, including the PRO-51 scanner for HALF PRICE. So I bought one. Sale ends June 30 or July 1.

Apparently, the PRO-51 is a non-US-only model. It is similar to the PRO-43, but it is made by Uniden.

Short specs:
bands: 29-54, 108-174, 406-512, 806-956, excluding CMR. (geez, you'd think RS Canada would take advantage of no ECPA here!)
200 channels + 10 monitor channels, and priority scan.
No PL or many other bells & whistles, except can charge NiCds built-in.

It seems fairly sensitive except near the FM band, but I haven't run any bench tests on it. FM interference rejection seems excellent.

My only real beefs with it is its IF is only 10.8 MHz, so it's pretty susceptible to images, and the audio output is not high enough for vehicle use. The keyboard beep is mildly irritating too: it's not controlled by the volume knob, and is pretty loud in headphones.

Anybody know anything more about this unit? I can't find mention of it in any of the usual places.

A cheap and very effective scanner antenna is using a single strand of telephone wire about five to eight feet long. Strip one end about 1/2 inch and put it into the middle of a twist-on BNC connector. Secure the wire to the connector and run the wire vertically. It gives very good range and clarity to signals.......

shap@i-2000.com wrote:
: does anyone know how to convert a scanner to a transmitter?

Yes, here's how:

1) Take your scanner and package it up nice and safe.

2) Mail me the scanner and $600.00

3) Wait about two weeks

You will then receive a nice scanner that transmits. The case and brand
name might be different, but don't let that bother you. You will be able
to scan and transmit.

Rick, I have a similar recorder, and the volume going into the recorder is controlled two different ways--by the volume control of the scanner, and by the volume control of the recorder. So if the volume of the hum is not controlled by the scanner volume control, try turning down the volume of the recorder when you record. Another shot is to buy Radio Shack's attenuator jack that reduces the input signal automatically--costs maybe three bucks. Good Luck!

The displays in the Uniden BC200XLT and BC100XLT portable scanners are
lit by an entirely different mechanism.

The EL backlight in my PRO-2006 grew dim gradually, over the course
of several years. I always had the light dimmed using the front
panel dimmer switch. Since it was an earlier PRO-2006, the switch
in my unit did not disable the backlight entirely.

Don't worry about the backlight *too* much, i.e., to the
point at which it interferes with using PRO-2006.
Order a replacement backlight and a service manual --
then use and enjoy one of the best scanners ever made.

5660. Good Belt Holder for BC200XLT???

Newsgroup: rec.radio.scanner
Date: 1995-06-27 00:00:00 UTC
From: rout0003@trout.itlabs.umn.edu
Message-ID: <DAtB3K.88D@news.cis.umn.edu>
Source record: 253621

I was wondering if anyone can suggest a good belt holder for a BC200XLT?
I already have the one that comes with it, and would like something
different. Here is what I am looking for:

o Solid belt clip (not a belt loop)
o Unrestricted access to keypad
o Black (at least not grey :-)

If anyone has run across one, would you please let me know?

Thanks!
- Andy

5662. Mods Needed For Yaesu FT-530

Newsgroup: rec.radio.scanner
Date: 1995-06-27 00:00:00 UTC
From: Roger.Breece@launchpad.unc.edu
Message-ID: <3spqsb$1f66@bigblue.oit.unc.edu>
Source record: 253623

I am seeking information concerning what is required to modify a FT-530 Yaesu that is a pre-ban unit. I desire to open the receiver so that it can receive the 800 MHz frequencies.

The friendly folks at Ham Radio Outlet/Atlanta said this could be done with a minimum of hassle and now I want to try this. So I would appreciate any info you might have especially regarding modification books with title, author, and publisher.

Since my Internet surfing on this bbs is limited, I can be reached promptly and directly at the following e-mail address:

roger@gomez.msfc.nasa.gov

Thanks for your help.

Just a few corrections. The "DETECTIVES" frequencies are not trunked and there is no 6 district. The channels you have listed as 61 to 66 are already assigned to other users (see your own listing) with the exception of 861.1875 which is used by the Marine Unit.

Source record: 253627

Subject: MAXON GMRS?

>>Anyone use the new GMRS radio, 210+3 or whatever they call it? The 10 channel Maxon one?

I use two daily. There are scores of them in field use here in Southern California. They are excellent units. And I can buy two of them for what an Icom U-16 sells for.

The Maxon GMRS 210+3 provides 2 Watts with its supplied rechargeable nicad pack, and 5 Watts when operated with the included 12VDC auto cord.

10 channels (7 interstitials, 462.675, and two programmable channels).

An eight button keypad is used to select channels, program radio features, and initiate scanning modes. Channel, frequency, and radio status info are displayed on the unit's illuminated LCD display.

User-programmable options include CTCSS, scan delay time, power save, channel lockout, and transmit time-out timer.

The "High/Low" power switch & control knobs are conveniently top-mounted.

Included with the unit is a rechargeable nicad pack, rubber duck antenna, AC/DC charger, vehicle power cord, belt clip, and hand strap. Available accesories include an external mag mount antenna, base omni-directional antenna, 3-Watt alkaline battery pack, speaker/mike, mini VOX headset, and a nylon case. NOTE: This unit WILL use Icom accessories - and Radio Shack HTX-202/404 accessories!

They list for 299.00. I buy them (small quantities) for 212.00. I sell them for 239.00 - BUT, $25.00 of that goes to my local REACT Team. Available at ATTENTION to Details BBS (no shipping charges this month, either!) at 909-681-6221.

5668. Spacing between scanner antenna and TV antenna?

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: jeffg@pacifier.com
Message-ID: <3sstm2$bqb@pacifier.com>
Source record: 253379

I'm putting up a TV antenna and also want to install a scanner antenna. What I've got is an all-bander ground-plane antenna. It occured to me that there's probably some optimum spacing between the ground plane of the all-bander (on top) and the TV antenna (on bottom). See crude ASCII drawing below

```
|
|
|
|
|
|
|
|
|
========================= <- all-band GP
#
#
# <- mast
#
#
////////////////////////////////////// <- TV antenna
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
#
#
#
#
```

What should the minimum and optimum distance between the all-band ground plane and the TV antenna?

I figure about 18" should be enough, but with a six-foot mast and clearance from the chimney it's going to be difficult.

Jeff

Cross-posted to: rec.radio.scanner,sci.electronics

Grove Enterprises, among other companies, sell frequency doublers (tune to 400 Mhz on your scanner, get an 800 Mhz signal in return).

What I am looking for is a frequency divider - tune to 400 Mhz, get 200 Mhz.

I'd like to monitor Military aircraft and other types of military communication (which mostly live in the 200 - 300+ Mhz range).

Most scanners cut out the 200 - ~400 Mhz range. I'd like to restore it without having to buy another scanner just for this.

If anyone knows of either a simple, small kit I can build, or of some company which sells a divider, please let me know.

Thanks much in advance.

>scanning and is not fixed on an active frequency.
>
>First, why would it do this? Second, is this common at all, or just on
>certain types of scanners? Third, is there anything I can do about it?

I'm assuming that the recorder lacks a VOX sensitivity adjust, and/or
the sensitivity can't be lowered enought to ignore the hum.

Are you connecting the microphone input of your recorder directly into the
speaker output of the scanner? If so, you may need to use an attenuating patch
cord. The mike input is designed for very small input signals, while your
speaker output has relatively high output. I made one with a ten ohm resistor,
some shielded audio cable, and a 1 uF non-polarized capacitor with a
35 mm film container as a housing. What I found to work was to put
the resistor across the cable coming from the scanner, connect the
shield straight through to the recorder, and connect the capacitor
between the input of the recorder and the non-shield end of the resistor.
One day I'd like to try some SMT parts to pack this into a connector...

The attenuating patch cord may cut the apparent amplitude of the hum
down enough so that it doesn't trip the VOX circuit in the recorder.

If the hum you're talking about is an AC hum, then the hum is coming from
either the power supply of the scanner via the audio output (assuming the
scanner is AC-powered), or is being picked up by the recorder or cable
between the scanner and the recorder. The latter is the simplier to fix; trying
moving the cord around and seeing if the cord is picking up noise radiated
from any AC transformer (I'm not familiar with the 8500XLT, so I'm
assuming it has an internal power supply) such as the power supply
for the scanner. On that same thread, the recorder itself may be picking up
radiated noise from any nearby transformer, so experiment with moving it
around as well.

Or the scanner's audio output amp' could just be powered by a poorly filtered
power supply. If you have the resources, you can try to power the scanner
off a DC supply (battery, external power supply of sufficient capacity) and see
if that resolves your problem.

Another cause may be a ground loop between the scanner and the recorder
if they're both running off separate AC power supplies. I'm not going to

pretend to know how to resolve this mode of noise, because I *don't* have
a good understanding of it.

Good luck! I use a Sony VOX-operated recorder on my old PRO-30 scanner. The
entire arrangement is powered off their respective wall-wart cube power supplies.
Haven't had any problems yet.

>gold...it will be more profitable and just about as easy!

I hate it when someone, who may really not be that knowledgeable about radios
asks an innocent question, and should get a good answer.

First, why do you want to transmit. Most folks have a scanner to listen to
police, fire, and other EMERGENCY/PUBLIC SERVICES. Unless you are authorized,
or have and emergency (as in life or death), just don't do it. I do have a
public service rig, and it scans, and I have a authorized call sign, but if
its not life or death, I use the autopatch from the local repeater first.

But, there is a solution. Get yourself a technician class amateur radio license,
there you can sell you scanner and buy a dual band scanning rig that allows you
to transmit on 2M and 70cm ham frequencies. Thats the easiest method to have
a scanner that transmits.

Oh, no flames allowed.

>What I would like to know is: Did I buy a GOOD scanner for my money?
> It was on sale for considerbly less than
> the normal list price.

> Ron Cole

I'm guessing you bought it in May when it was on sale for $229. That's when I
bought mine. You can order it for under $250 every day, but then if it
doesn't work when you get it. . . . . Anyway, It is one of only a hand-full
of triple conversion hand held scanners that cost less than $300. Actually,
it is the only one I can think of that cheap, but I'm sure I'd get flamed if
I stated it was the only one :)

I think it's great, seems to receive as well as my PRO-2006 when hooked to the
same outdoor antenna. It seems to last quite a while on NiCDs, too.

One thing, to GREATLY improve reception, buy a different antenna. Radio Shack
used to have a great telescoping BNC antenna, but they discontinued it.

Happy Scanning,
dewayne

During the Clinton campaign, Al Gore came to my university to address the college democrat group - I took my scanner to the vicinity and got to hear all the traffic there was, from the moment he landed at the airport, the motorcade to the campus and all the stuff during the speech. It was, in short, a blast. I fear, however, that it's not going to be that easy anymore. <sigh>

> Thanks for the info Erik,
> What everyone is probably wondering is how much and where can we get
> them?? Thanks in advance.

We have a revised list of discounted pricing available on new products from AOR, Opto, GRE, and CRB. This would probably be of interest to the majority of readers on this list; however, due to a few self-appointed "net cops" that complain about product lists, I'm hesitant about posting it here. :-(If you'd like a copy, just drop me a note and I'll e-mail you a copy. It's a greater hassle for many of us; but it will save a couple of those complainers from having to press the "N" key! :-)

All the best!

After doing dozens of net deals, here are some pointers, especailly if your worried about it:

Send your understanding/deal in writing via Email and with the check.

(IE: Enclosed find a postal money order in the amount of $.02 for a Icom 781 allmode HF transciver in mint condition with [list accys including the 110' crankup]) Use the Memo line detailing the purchase too.

Pay via a postal money order (they become the investigating body if you get ripped off.) Send your order return reciept. Get a telephone number and talk voice. Here's another idea, see if those checks your creditcard company carry the same benefits as any other card purchase, mine do. (Have your Credit Card compnay backup the purchase. I don't think this is universal [as they don't have the same recourse with a non-vendor.])

Get a reciept with model, make and serial number. Keep it with the seller's info. (Heard stories of people claiming sold merch. was stolen after they had sold it. Hasn't happen to me tho.) Have the reciept signed, dated, get get a spot of blood to be sure.

Anyway, basically involve the post office, since they hate being used to swindle people and have an exceptional track record.

Make alot of paper to making sure things are clearly spelled out and documented. It solidifies a transaction and legal action if need be.

FWIW, never been burned tho....

>My address : bobba@nqueeg.ICO.OLIVETTI.COM

I have a HF 150 in my coral of radios. I think it is a good performer. It is very small and simple to operate. If you you an outboard speaker like the Grove SP 200, it can sound quite nice. I installed the backlight kit, which makes the radio usuable in a dark room. The mail order house said it was "simple to install" (NOT). I would also advise the outboard keypad, which makes life much easier. I have found the sync det akward to use. It requires very fine tuning. Others have like the "fidelity" option, but frankly, I can't get it to work with a darn.

For day to day listening, I actually like my AOR 3030 better.

Hope this helps,
Mike Kuna

5699. Las Vegas "RATPAK"freq?

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: markj@sensemedia.net
Message-ID: <3sqoae$cui@Sequoia.picosof.com>
Source record: 253455

While working as a Videographer at KTNV-13 a few years back,I responded to a bank robbery. While I was getting my cover video,I noticed,off my scanner,that "Metro" was tracking the suspect with a helo and ground units. The transmissions consisted of the officers reffering to"hits" and "Direction of hits". Within 20 minutes the suspect was in custody and the money was recovered from a dumpster. Well I put 2+2 together and learned that there was a "RATPAK" transmitter in the money bag. Well I thought this was a great angle to a rather "routine" story,but the Managing Editor said we could not report that because a "deal" had been made with the FBI not to report the use of the transmitters.The reason she gave was that Las Vegas used to have the highest bank robbery rate in the nation. Well I think* that policy is B***S**T,but I can argue that on alt.journalism.
Does anyone in Las Vegas know the EXACT FREQUENCY for the "RATPAK"s?
I know that L.V.M.P.D. units have an array of three antennas in addition to the voice and mdt antennas on the roof. I can "read"antennas quite well,but these baffle me. I dont think these antennas are used for "lowjack" transmitters since these antennas were in place long before the "Lowjack" system was placed in use. I could be wrong,maybe they share frequencys.
Please don't post where to "search" since I'm only in Las Vegas a few times a year now,
and with the low power these things emit the chances of me being near one or near the next Las Vegas bank robbery,are pretty nil.

If anyone is wondering just why I want this info...It's because I want to give up my current TV job and home on the beaches of the Monterey bay and robb all the banks in Las Vegas...and not get caught. 8-#

Thanks
Mark(Mr.News)Jeannette

P.S. Las Vegas TV stations also WON'T report that Neveda Highway Patrol officers carry "SPIKE STRIPS" to blow out evading cars in high speed pursuits. Here in California,the cops fight over the chance to show TV cameras how effective the "SPIKE STRIPS" are.(go figure)

> From: Geoffre296@aol.com
>
> The best one out there i think is the OptoElectronics Model CX12 that
> you can get from them.

We provide clients with the Opto CX12AR; this is a new and improved replacement for the old Opto CX12. Make sure you get the new CX12AR; the CX12 is $10 cheaper but it lacks the CX12AR's functionality with the AR8000 (that's what the new AR suffix stands for). Here's a quick comparison of the computer interfaces that I posted in May...

There are currently three alternative computer interfaces for the AR8000:

	Manufacturer	Model	Approx price	Approx size	Advantage over other alternatives
1.	AOR	CU8232	$125	12x7x3 cm	Allows AR8000 cloning
2.	EDCO	AR8000INF	$100	6x5x2 cm	Small size (DB25 hood)
3.	Optoelectronics	CX12AR	$ 88	10x5x3 cm	Also use with Scout 40

We have been providing the Opto CX12AR to our clients since it recently became available. Besides lower cost, its main advantage is that it has four ports so you can connect an AOR AR8000, an Opto Scout, and up to two more devices to your computer simultaneously; the AOR and EDCO interfaces only support the AR8000. If you eventually buy an Opto Scout (like many AR8000 owners do) you will avoid buying two interfaces with the CX12AR.

All the best!

5701. skip

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: cseymour@mbunix.mitre.org
Message-ID: <3srigt$iae@linus.mitre.org>
Source record: 253457

Tuesday evening (6/27) brought skip from numerous points across the US
into the New England area, and I'd like to pin down some stations heard.
If you're familiar with any items listed below, please drop me a note.

33.78 Mhz "Hilldale County", "North Adams", KDY531 KCA359 discussing flooding(?)

33.90 Mhz "... *sputter* 9-1-1 with the nightly tone test to ... *sputter*"

33.84 Mhz "Engine 2-31" "Accident at Bluebird and Timber Lake"

33.98 Mhz WNAC522

42.34 Mhz KSZ242(?) "State Police, Chicago(?)" discussing retail theft suspects
in "Burbank". "Moleen" also mentioned, but may have been
from another distant station.

42.38 Mhz KII203 "Kirkwood", "Rock Ridge", "Franklin County" all mentioned.
"Clinton exit at 70 & 271", "Kay-Double-Eye 203"

42.42 Mhz KLT229 KSZ771 (Indiana State Police?) "Lafayette", "Putnamville",
"Evansville", "Seymour" mentioned. Heard multiple broadcasts
regarding motorists who were separated during travel on 70.
"North Vernon", "Huntington County", "Sullivan County"

42.44 Mhz KZA240 "Tuscola", "I57" (Maybe Illinois?)

46.10 Mhz KBA431

46.46 Mhz "Fire at the Hancock Dorm on Hancock Drive", "EOC"

The usual bunch from Hamilton County and Cleveland ("wheels rolling") Ohio,
and South Carolina State Police were booming in also. I love summer.

On pg. 26 of the July Monitoring Times , Glenn Hauser's article
entitled " Oklahoma City: The Radio Aftermath", states;

"WWCR's other superpatriot programming such as Tom Valentine
and the white supremicist William Cooper continued unabated
primaryly weeknights on 5.065.00 Mhz, but also scatttered at other

times on other frequencies."

At 04:03 UTC Bill Cooper, on The Hour of the Time program of Wed.
June 28 1995 stated:

Well, I'm in the process of suing the New York Times and I'll begin
the process to sue MONITORING TIMES and GLENN HAUSER."

About time someone challenged the far-left pro-homosexual writing of
Hauser et al. MT has long had a "Left" bent, and now the errors of
allowing Hauser to spew his Radio For Peace stlyed attacks has come to
roost.

Mr. Hauser can be reached at: GLENN HAUSER
Box 1684-MT
Enid, OK 73702
fax- (405)233-2948

and William Cooper can be faxed at (520) 337-2922

5710. Lotsa Central Florida Freqs for Scanner Freaks

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: ken_a_ailsworth@ccmail.orl.mmc.com
Message-ID: <9506281532.AA30258@theopolis>
Source record: 253466
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Here's a list of scanner frequencies for the Central Florida area. They're by frequency; if you want 'em by name, just import 'em into your favorite word processor and do a sort by the second column (didn't want to use up bandwidth with two lists...and am lazy to boot).

Most all of these are good. The only obsolete ones are the 460 MHz Orange Co. Sheriff freqs. - the sheriff has moved to 860 MHz on a trunked system (also listed). Some I don't know what they are (esp. private Common Carrier freqs.); if anyone can ID those mystery freqs., sure would appreciate the info.

Happy Scanning!

Ken_A_Ailsworth@ccmail.orl.mmc.com

5711. discone

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: turk@flowbee.interaccess.com
Message-ID: <3squnf$h4t@nntp.interaccess.com>
Source record: 253467

I am thinking about purchasing a discone antenna for the top of my roof. I saw the one that Radio Shack has for sale for something like $60. A friend of mine bought the same antenna and he says it works great. What other brands of discone antennas work good. Would buying something high-end end and expensive really make a difference or would I be better off just sticking with the RS model?

5712. Bill Cheek's latest book any good for Pro2006 owner?

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: ghopper@eskimo.com
Message-ID: <DAwKoG.Evz@eskimo.com>
Source record: 253468

I just noticed that Bill Cheek has a new scanner mod book out. Is it worth buying? I have a Pro 2006 and was planning on doing a little work on it. I have the first two and was planning on doing several of the projects. Should I get this one too?

Grant Hopper

5713. Radio systems in your community

Newsgroup: rec.radio.scanner
Date: 1995-06-28 00:00:00 UTC
From: drice@enuxsa.eas.asu.edu
Message-ID: <DAwpvo.Ho6@ennews.eas.asu.edu>
Source record: 253469

This is a repost of an article which I sent out yesterday. I was reading the article, and went to hit "c" to clear out the rest of the messages in the group. Unfortunately, my caps-lock key was on, and instead of clearing the group, trn very obligingly send out a control message to cancel my post. Most sites seem to honor these cancellation requests, so I am re-sending the message. I apologize to those of you who are receiving this for the second time. I'm not usually this clumsy.

Original message follows:

I'm interested in knowing what types of radio systems used for fire and police communications throughout nation (continent? world?).

I am not looking for specific radio frequencies, rather I am interested in what frequency bands are used, how many channels are used, whether the channels are repeater or simplex, etc.

I'm hoping that this list an eventually be added to the FAQ archives for this group. Even though it wouldn't contain specific frequencies, it would be useful to travelers who want to know which ranges will contain activity. It will also be interesting to people who just like to know how things are run outside of the range of their scanner antenna (like myself).

Here is an example of what I am looking for, using the Phoenix Fire Department:

Phoenix Fire Department operates 12 non-trunked analog-format VHF-hi channels. There is a dedicated dispatch channel, which is used for all fire and EMS dispatches. No tactical traffic is handled on the dispatch channel. The dispatch channel and all tactical channels are simplex (i.e. no repeaters). One dispatcher will often simulcast on several channels when traffic is light. Channel assignments are determined by geographical area, barring any unforseen overloads.

I think that gives a general idea of the type of information I'm interested in. For police, the format would be different, but it would probably be pretty self-explanatory.

For a trunked system, please include information such as number of channels, and whether or not any trunked channels are simulcast on another band. Also, information on on-demand (or continuous, heaven forbid) encryption would be useful.

I'm planning to put this information into a chart form, something along the lines of:

City Dept Chan Trunk? Crypt? Dedic. Disp? Simul?
Phoenix, AZ Fire 12 N N Y Y

Or something like that.

Please reply via e-mail only, as there is no point in cluttering the group with followup posts. I'll mail updates to people who indicate that they are interested, and also post to the net if there is enough demand.

Thanks for your help on this.

The new breed of wireless mics can be found from 794.000 to 806.000,
there are 94 channels in this range. also check in the 900mhz band. I use
two 900mhz mics for electronic news gathering in the 954.000 and 947.000
range. theses new systems are used by the major shows and TV crews more
and more. These systems are frequency agile and offer very little
interference.

> I am looking for some frquencies for Michigan. Any 1 frequency will help.

Your best bet will be to go to Radio Shack and pick up the police call
book. It has all the frequencies for MI.
just for starters though I'll give you a little sample

U of M Survial Flight 123.05 Mhz
Medwest MedFlight 130.00 Mhz
Huron Vally Ambulance Dishpatch 155.295 Mhz
Southfield Disp. 424.325 Mhz
Southfield Fire 423.675 Mhz
All Hospitals 154.34 Mhz (Ambulances giving report, normally you won't
hear the ambulance unless you are very close, but you can usually hear
the Hospitals.)
Well, that's all for now.
Later,

You're location is going to make a big difference on performance. Ken
mention SF, that's a very RF dense area and takes quite some signal
to be 10-20 dB over the noise floor. If you use a 46" whip and expect to
read UHF, you should lower the antenna more (to about 8"). Better yet,
an antenna like a resonant ducky for the target range is better, since
the tuning will actually help cut down out band signals. The DB32 is probably
a good compromise, but don't expect stellar performance outside it's
2 resonant areas, VHF and UHF. If you're near FM broadcast towers, a
cheap $3 Radio Shack FM trap will knock down the FM band significantly.

The Scout is not a tuned receiver, Opto should have include some basic
switchable band pass filters, nothing fancy, just enough to knock down
some background noise. Folks lucky to live in rural areas have reported
significant success over those who live in big cities. If you do live in
a rural spot and there's a 5 kilowatt pager tower 1/2 mile from you,
you may as well be in the city!

Seing as how it's pretty much full coverage from 150 Khz to 30 MHz, the
traditional limits for a SW receiver, I'd say it pretty much covers it
all. CB, at around 27 MHz is already covered.
For NOAA weather and TV, you need a scanner that covers those frequencies.
SWR's don't go that high.

colvin@hyrax.rand.org (Tim Colvin) wrote:
>
>I have noticed that some L.A. County Sheriffs end *some* of their
>transmissions with the letters KMA. What do these letters mean?

Tim:

The phrase "KMA" (each letter pronounced) is a shortened form of the old Los Angeles County Sheriff's "KMA 628" FCC Call Sign. It is used by some deputies to signal the end of a radio transmission (i.e. "over" or "go ahead").

This use has nothing to do with the civilian expression of contempt (Kiss My....).

Prior to joining the Fire Service, it was my pleasure to serve as a dispatcher for the Los Angeles County Sheriffs Department. It remains my pleasure to continue to work alongside the dedicated men and women of that agency.

I hope this helps.

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department

There are many answers to this. Let me try to rattle off a few:

1) It provides a convenient "external enemy", a political
technique which is tried and true.

2) It provides a source of income for the government (via
civil forfeiture procedures).

2) It provides jobs for law enforcement personel.

5750. Cordless from miles away?

Newsgroup: rec.radio.scanner
Date: 1995-06-29 00:00:00 UTC
From: alanoue@shrsys.hslc.org
Message-ID: <29JUN95.22572676@shrsys.hslc.org>
Source record: 253357

While monitering 46.870 I heard a conversation during which the cordless owner indicated their present location. It turned out to be on the other side of town almost 2 miles away! How could this have been possible? Do these frequencies skip around? Naturally, I discovered this freq. by accident.

5751. BC80XLT info wanted

Newsgroup: rec.radio.scanner
Date: 1995-06-29 00:00:00 UTC
From: jeremy7281@aol.com
Message-ID: <3svjgl$e3h@newsbf02.news.aol.com>
Source record: 253358

A friend of mine just purchased a BC80XLT for $250. I (and he) really don't know anything about Bearcats and purchased this pretty blindly(I'm still using my Pro-42). Is this a good unit? Was that a good price? Is there a mod. for it? Any other info worth noting?
Would appreciate a reply here or e-mail. Thanks.

-Jeremy

>any clues on how to do this? Any other tips/info on the SC?

I haven't heard of any easy way ... just keep smacking the up/down keys
(but it gets old fast).

STUPID TRICK: check the juice left in your unit by holding the WX and L/O
keys when you turn it on. When the readout gets around 1.50, (or maybe
it's 1.45) your LOW BAT indicator will start beeping.

ANOTHER STUPID TRICK: L/O and 2 and 9 at power-up will put it in test mode
and your display panel will light up like a Christmas tree. To get back to
normal, hit 2 and 9 and any other key at power-up. Be warned -- this will
blow out all your programmed banks.

You might be able to get it from the Tandy Service Center 800-442-2425. Ask
for the part number including the dash ("GRE-0327"). If you don't include the
dash, then they won't be able to find it in their computer unless you know the
chip location like IC501 on the 2006.

> The CPU is a GRE-0327, obviously a custom programmed processor. Anyone know
> who made this chip? It is possible that the PRO-2006 also used the same CPU
> since most of the PRO-2004 to PRO-2006 changes were cosmetic.

I just spoke with them today about the 2006 CPU and they didn't know who
made the chip but they were going to try and request a spec sheet on it
for me. If I ever get one, I'll let you know. Unfortunatly the CPUs are
different. The 2006 uses the GRE-0918 which costs $38.32. I tried looking up
the GRE prefix in some IC books I have and I haven't come up with any leads.
The person at Tandy that I spoke to said it was made out of country. I'm
looking for the spec sheet and app notes for it if you here of anything.

I would reccomend the Pro-62 by Radio Shack if you can still get them.
It is slightly above your price range, but well worth it. It is able to
scan all of the freq's you want (I don't reccomend telling people that
you want to listen to telephones though! It is now illeagal to do so!)

DG>Contrary to what they show on TV, few agencies have terminals in
DG>their vehicles. Everything is transmitted by voice.

Au contraire. More and more agancies are realizing the benifits of mdts,
and are switching. What is not usually done via the mdt's is the
dispatching of calls; info re records, histories, et.c is the norm on
mdt's. One possible reason is the officer doesn't have to take his eyes
off the road to acknowledge a call., but once there he can investigate
people without tying up the dispatcher.

I've got to add my .02~

I have been moving equipment around for over 20 years and I do it to keep
my own hobby going. I've always offered a prospective buyer references
to people I'd sold stuff to before. When I buy stuff I ask for
references too. Not only do I want to have a good idea of what condition

the thing is in, but does the seller know how to pack it properly to survive the shipping? Also if a fellow has a ham call its a pretty good bet that he's okay. Yes, there are a few bad apples out there with radio licenses, but by and large the ham folks are pretty decent people who won't cheat and lie.....

These have been my findings in over 20 years of hosstrading.......

73,

Michael Crestohl KH6KD/W1

5763. Independent Pager Hardware and Software Review Here

Newsgroup: rec.radio.scanner
Date: 1995-06-29 00:00:00 UTC
From: openop@ix.netcom.com
Message-ID: <3sv898$o1q@ixnews3.ix.netcom.com>
Source record: 253392
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap,rec.radio.shortwave

Recently there sure has been a lot of coverage in the communications magazines regarding Pager Software and Hardware -- I think Monitor and Popular Communications have recent articles for Aug 95 and July 95 issues.

I purchased 2 different software packages within the last 4 months and here are my observations:

Version 1.2 of the KTL Message Tracker software package that hooks up to the audio port worked the first day on an R1 with lots of error messages .. from that day on I couldn't get it to work at all on the ICOM R1, AOR 3000, ICOM 7100 or RS 37. The technician was nice on the phone and I sent the package back and he returned a new device with a new diskette. I still haven't been able to get it to work in the last 4 months.

I purchased a device recently from jsoft which hooks directly to the descriminator inside the ICOM 7100 (between resistors R228 and R230) with a .47 microfarad capacitor (20Volts or more). The software is easy to use and it produces error free results .. I am able to see that my messages are actually being sent. You can filter so that only your messages are displayed or your groups messages are displayed.

My recommendation is to go with the best -- jsoft. The jsoft package is actually being used in pager shops .. it must be the best .. better than units costing $10,000 or more. jsoft sells this unit with software and hardware for $199.00.

In no way am I affiliated with jsoft. These are my own observations and recommendations.

jsoft can be reached by email at jsoft@mcs.com

Considering how I've replaced a half dozen of these things(the EL panel),
I don't know how you can say the light is as good as when you bought it.
When I did my 2004,I saw that the light dimmed down after a couple of HOURS!
Needless to say,I did the mod to change it from high\low to high\off.Just like
Radio Shack did on later 2006's.My 2004's light was so dim(about 7 yrs old)you
could not see the dim light IN THE DARK!On high it was at least bright enough
to see what freq it was on,but it wasn't easy.
The deal is,if you put a newly re-EL paneled 200x and one that had even a few
hours use side by side,you WILL notice the difference!The EL panel was a
mistake to use,in other words,a design flaw,just like the PRO 43's easily
burned out speaker that was originally installed at the factory.These scanner
manufacturers try to get off cheap if they can.Look at the bearcat 2500\8500
disaster for uniden.The marketplace forced them to "enhance "them into the
3000\9000,and for once Uniden did something right!

Later,
Barry Felstein,N8PVX
using Brad's acct......

FYI, The california State Police cease to exist in two days. They are
going to become part of the highway patrol. How this is going to affect
thier frequecncies is anyone's guess.

Tom,
As a bit of humor, a co-worker who bought a PRO 2035 on sale recently, and then experienced my BC9000XLT, said that the biggest annoyance about the 9000 was that he didn't own one !!

Your comments however, are well taken. And, I wish the ext.spkr. jack was on the rear off the unit........

>A little expensive.

The latest version of HamComm (Ver 3.0) has a basic AF Spectrum Analyser and Oscilliscope for tuning a radio for RTTY, etc, reception.

At present it uses a little external OP amp connected to a serial port although I'm sure there is mention of it using a sound blaster card?(may be wrong but open to correction).

Available via FTP from several sites.

>> when I visit soon. Any info/freq info/etc would be appreciated!

Basically - be careful and don't flaunt it; although the number of Discone antenna scattered around can't all be amateurs :-)

Some areas of interst are 147MHz - local police (duplex with 142MHz)
152MHz - Mobile Police and major incidents
70MHz - Fire (I think)
450MHz - local police (gain)

If you come soon you might just catch the summer! Rumour has it it's on Thursday and Friday of this week!

>certain types of scanners? Third, is there anything I can do about it?

The problem is that if you turn the volume on a Bearcat to max. when
scanning, you can faintly hear the "scanning noise" that the scanner makes
as it scans. I don't know the technical details of this, but I do know that
if you have a sensitive VAS then it will trigger it. You can:

1. Turn the volume on the Bearcat down to a level where the recorder is not
triggered by scanning but can still activate on a received signal;

2. Adjust the sensitivity of the VAS if possible. This is almost the same as
turning down the volume of the scanner.

3. Try the idea of someone else: attenuating the signal. A previous reply to
your question will help you here.

Good luck.
>Thanks for your help.
No problem.

Jim, can you tell me what characteristics your 2004 exhibits when it
"loses its mind"? My 2004 will scan for about 15-20 minutes then it locks up.
The LCD will be stuck on a particular channel just frozen. Keypad is dead.
Power cycling doesn't help. If turn it off, wait 1/2 hour, it's ok again
for another 20 minutes.

Sometimes (1 out of 25) when it locks up the LCD will have all segments and
annunicators lite. My guess is this is a thermal problem but I find it hard
to believe a CPU (a piece of silicon) should have thermal instabilities in
20 minutes.

In article <DAsE63.94n@ncrcae.ColumbiaSC.ATTGIS.COM>,
Jim Griggers <jdg@devine.ColumbiaSC.NCR.COM> wrote:
>Someone (Ken) pointed out that Radio Shack has an 800 number for parts and

>The new breed of wireless mics can be found from 794.000 to 806.000,
>there are 94 channels in this range. also check in the 900mhz band.

This range is smack in the middle of UHF TV channels 68 and 69.
Does anyone know if there are any alternatives to wideband
scanners for picking up these sorts of mics. For instance,
would a Watchman type TV let you tune these WFM signals? or would
it only let you get the audio that fell where the TV audio
was supposed to be? Would they get the signal at all with
no video there? Might this work with the old analog Watchmen
but not the newer digital tuners with built in 6MHz tuning perhaps?

A related question: Does anyone still make portable radios that
tune the UHF TV band? These used to be common, but I haven't
seen any around for a while...

I picked up a Panasonic RQ-L317 Voice activated recorder for about $40.00. I have used it on the BC3000 and my PRO-2006. A must though is the radio shack attenuator cable. It enables you to take a speaker out and plug into the mike input on the recorder. The recorder is just a small one like a walkman type player but it also has a speaker in it for play back. It works real nice and the sound quality is good. The only draw back is max time per tape is at most 60 minutes with a 120 minute cassette tape. The VOX feature on this unit works great too.The unit also has speed control that only works on playback though. I wish it worked on record too for more time but it doesn't.

Hello All,
I am new to the scanner scene, and I have 2 questions I hope that
all of you experianced experts can answer.

1- Can somebody post a listing of all the good frequencys for the
Central Ohio Area? PDs, Fire, EMS, etc...

2- I recently bartered a Radio Shack PRO-50, which seems like a nice
scanner, but upon further investigation, I notice it doesn't cover all
those wonderful 800+ bands you all seem to be talking about. Is there any
way to modify/reprogram this unit to cover more freqs? I will talk to a
Rat-Shack salesman tommorrow, but I bet the folks who post on this
newsgroup would probably have better answers for me. Thanks ahead of time
for your feedback...

>--

The most used would probably be 2182 kHz - that's the Calling And Distress frequency (worldwide). It's just like the VHF channel 16. The working frequency is 2670 kHz (just like VHF ch. 22a).

But I bet most of the CG's communicatins are conducted on VHF on the Lakes.

There are 4, 6, 8, 12, 16, and 22 MHz SSB frequencies that the CG uses but these are mainly for the high seas. If your library has a government documents sections you can find the list of freqs there. It's been too many years for me to recall them, but 8765.4 and 13,113.2 kHz SSB come to mind. (1980). Look for the publication titled Radionavigational Aids or something like that.

Hi !

I read your review of the two pager packages.

Why not try my shareware program PD-102.EXE, available from
ftp.demon.co.uk pub/ham/scanners.

This decodes 1200 and 512 baud POCSAG. It comes with a circuit
for an interface to a speaker output but will work best interfaced
to a discriminator, via an op-amp to give RS232 levels.

Pete.

Todd,

I've go a DX-390 too; it's a nice little rig. You can recieve CB frequencies on it without mods. Look for them between 26.95 and 27.41. Don't know about mods for weather or TV audio, but both are so far above SW freqs that I would imagine you'd have to do a lot of tinkering, in the process invalidating your warranty and maybe ruining your machine.

>accident.

There are a number of reasons why you overheard this transmission...
My personal "el-cheapo" Uniden 49 MHz cordless unit has traveled over
three miles thanks to some simple mod's. The first being simply ANTENNA
improvement! I have 1/4 wave stainless whip strapped to a tree and it's
connected to the "base" unit. I also use a telescopic whip on the handset
instead of the ducky. Secondly, I upgraded the 9V nicad pack to a 12V since
the thing operates properly within 6-14 Vdc. I know my range improvements
increase the opportunity to be eavesdropped, but so what! I'll just use
the landline for discreet conversations.
FOR THOSE WHO WONDER... My home is located on several acres and the stock
setup did not provide adequate service, hence, my need to enhance.

My 2 cents - anyway

-Greg @ worldwide

/
/Any truth to this and if so, would someone please tell me how the mod is
/done.
Yes that is true, well almost true. The mod is not made to the battery pack
but inside the radio. There is a small zener diode that mist be shorted
across. I think it is a diode, but it has been a long time since I did the
mod to my radio. Anyway this mod will allow the radio go go all the way down
till the display starts to dim. You can expect about twice the life from the
same nicad pack. I will try to find the mod and email it to you.

5814. Pro43 and Pro2032 S-Meter?

Newsgroup: rec.radio.scanner
Date: 1995-06-30 00:00:00 UTC
From: Gary Jacek <gjacek@yvr>
Message-ID: <BK.BW.804524493.1103527590.gjacek@yvr>
Source record: 253291

Hi

I have an S-Meter/AGC Detector Board, model CTP-SM1 that I ordered from CTP
(see Page 119 of the May Monitoring Times). This thing was easy to install with
the included instructions and works like a charm on my Pro2006. By using a shielded
cable I took the S-Meter connection outside the cabinet and into it's own little box.
This way I avoided any non-reversible warranty-voiding cutting and drilling activity.

Since the S-Meter lives in it's own disconnectable box, it is tempting to install similar
connections in my Pro43 and Pro2032. That way I can use it on any of the scanners.
Unfortunately the CTP instructions are explicit for the Pro2006, but are lacking for the
Pro43/2032.
They say only "You may need a service manual to locate the last I.F. amplifier
stage that feeds the NFM (Narrow FM) detector circuit of the radio.

I have the circuit diagram and board layout for the Pro2032, but it's not too descriptive
about where the last I.F. amplifier stage is located. Can anyone give me a pointer to which
component I want to connect the CTP-SM1 onto for a Pro2032?

Similarly, the only info I have on the Pro43 is a Bill Cheek posting from 1993.
Is the cathode of D-302 a good place to connect the CTP-SM1 on a Pro43?

Is there a Bill Cheek book that covers all three of these scanners? After all, at some
point
you gotta start paying for that R&D he does so well.

Thanks in advance for any advice you can offer.

gjacek@cyberstore.ca

From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

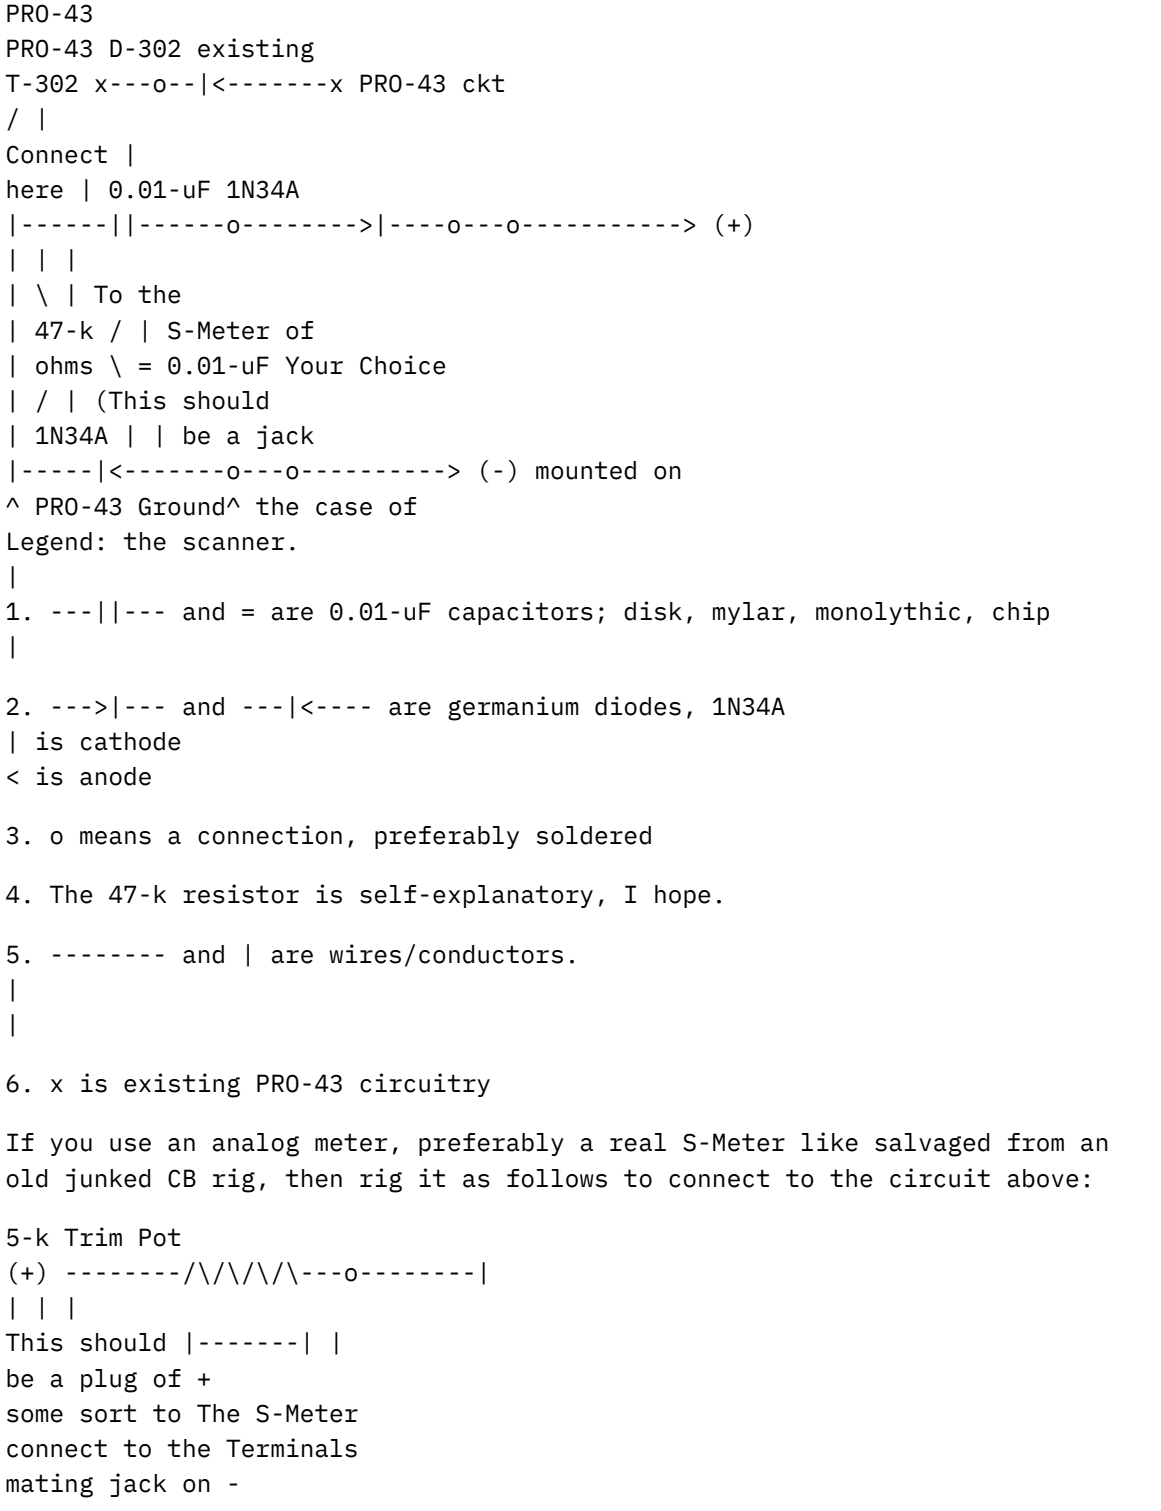
Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the
PRO-43! Only a simple circuit and your choice of meter, analog or LED, is
required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom
(solder side) of the AF Board (middle board). You will need the Service
Manual for the PRO-43 to find it as it's not marked and it would take me
10,000 words to guide you to exactly where it is located. Call Tandy National
Parts at (800) 442-2425 to order your manual: approx $10. Now here is the

deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



PRO-43
PRO-43 D-302 existing
T-302 x---o--|<-------x PRO-43 ckt
/ |
Connect |
here | 0.01-uF 1N34A
|------||------o-------->|----o---o-----------> (+)
| | |
| \ | To the
| 47-k / | S-Meter of
| ohms \ = 0.01-uF Your Choice
| / | (This should
| 1N34A | | be a jack
|-----|<-------o---o----------> (-) mounted on
^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|
2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode
3. o means a connection, preferably soldered
4. The 47-k resistor is self-explanatory, I hope.
5. -------- and | are wires/conductors.
|
|
6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

the scanner |
|
(-)----------------------------|

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Developed & distributed by: Bill Cheek

Go to the library and get the Amateur Radio Handbook. They are issued yearly -
any issue will have antenna plans in it. How small depends on how efficient
you want it to be. There are 2-meter yagis (144-148 mHz) that are around 2
feet long and wide.

> Since the cellular frequencies are fairly well known, if you are receiving
cellular calls outside these bands, you are receiving images or
intermodulation. Not too hard to figure out.
<

Is this bad to be picking up the images? After recent discusion on this, and after printing out a list of all the freq. I have programmed into my P39, I see now that I have around 23 that are above 894. Also, when comparing my number list to that which was posted for the input/output numbers, I hardly have any with in that range. For example. The output (according to the post the other day) should start at 870-879 and 880-894. Well, of the 75 or so freq that I have programed in, NONE fall in between those numbers. IN fact, none fall between the input side of the freq either. Except for those above 896, all of my numbers fall between 851 and 868.

Can anybody explain this?

Thanks,
Drew

I got my scout last night, and so far the jury is out on it. I discovered that a local FM station has a broadcast tower close to my home and it swamps the Scout with every antenna except the DB31. I've got an in-line filter on order from Star Tek, so that should help out greatly.

Even with the DB32, I could pick up my 2.5w 2m HT from 30 yards away. That is fine for what I want to use the scout for.

S> why is it that on certain freq. I can only hear the dispatcher and not
S> the cars ?

Good question.
I don't know where you are, or what your local system is, but here goes:
Here in Phoenix, we have a radio system that uses several repeaters, spread out over the city. The repeaters us the same frequency for input and output. The repeater has a much higher output than the radios in the cars. Depending on where the car is, I might be able to hear the repeater, but not the car, because the car may be just too far away from me (I'm on the West side of town), or the car may be behind a mountain (the repeaters tend to have a height advantage over the cars).
In other systems, the input and output frequencies are not always the same. The channels you are having this problem with may be duplex (differing frequencies for input & output). The repeaters don't have to repeat the car's signal, although most do, so other cars in that district can hear the whole story.
Hope this helps.

I can think of a few possibilities:
The cordless phone may have been at a height advantage (on the sixth floor
of an apartment bldg??).
There may have been a cordless phone on BOTH ends of the conversation, with
the other phone closer to you.
You may have one heck of an antenna??

A suspicion of poor sensitivity is not a good reason to embark on an alignment. First, find out if an alignment is necessary.
How's the antenna? Can you put a like receiver on your antenna and get better reception?
Is the coax deteriorating? An alignment won't make up for this at all.
Is there something recently changed to make reception poor? New metal near the antenna? New building close? New mountain nearby (;-))?
Is your attenuator accidently left on? It happens.
Is this something that happened suddenly, or over a period of time?
You may need an alignment. But there are things to check first.
IMO, if an alignment *IS* needed, check an authorized ICOM shop. More expensive, maybe, but that's an expensive puppy, and you don't want Bubba doing this between tow calls.
My two cents, and worth it!!

//voltage as well as establishing a lower voltage cutoff before the scanner
//turns itself off.

Yes there is and here it is:

Speeding up the scan/search rates for the Uniden BC-200/205 XLT
You will need a small crystal or ceramic resonator in the 600-800
kHz range.

1. Disassemble the unit to access the microprocessor area.
a. Slide off the battery pack.
b. Remove the two screws from the rear of the scanner and the
two screws that hold the battery retaining spring at the
base. Then remove the spring.
c. Carefuly pry the bottom of the rear cover from the scanner
and remove the cover.
d. Locate the two small screws at the base of the circuit board
and remove them. Gently pull the front panel from the main
frame at the base and separate them. If you separate them
between the two layers. Remember that for later reassembly;
the pins will have to be lined up perfectly before you slip
the sections back together.

2. Search around the logic/CPU board (Uniden calls it the "MICOM
PCB Assembly"), and locate Y-201, which is a little rectangular
component. This is the stock 400 kHz resonator. Your
replacement can be a bit larger if necessary, but not grossly
so.

3. Carefully desolder and remove Y-201. Put it in safekeeping
because you may want it for something else someday.

4. Install (solder) your newly procured replacement clock
resonator, be it a crystal or another ceramic resonator, where
Y-201 came out.

5. Reassemble: Insert top of the front panel into the slot under
the volume/squelch control panel. Carefully noting the alignment
of the dual in-line connector at the bottom of the board with
the mating socket, press the front panel firmly into place. Be
sure that the holes at the bottom of the circuit board line up
two screws and tighten them

6. Replace the rear cover by inserting the top of the cover into the slot under the VOLUME/SQUELCH control panel. Press cover into place. Insert and tighten the screws.

7. Reposition the battery retaining spring (slotted side toward notched hole). Insert the two remaining screws and gently tighten them.

8. Slide the battery pack into place. Switch scanner on to ensure that the display comes on. If not, the battery may be discharged or the dual in-line connector may have been misaligned during reassembly (step 5). Another possibility would be that the new resonator either doesn't work, is unsuitable, or may have been incorrectly installed. Another possibility (if you installed something greater than 800 kHz is that it's just too fast.

Assuming that the display comes on, leave the antenna disconnected, and run a speed test. Speed in channels-per-second equals the number of channels divided by the time in seconds. Using a Murata-Erie 800 kHz

Note that the channels must have frequencies programmed into them. "Empty" or 0000.000 MHz channels run faster and throw off the calculation.

In addition to the shortened delay time, the user reports that the panel lamp will "time out". Doubling the clock frequency halves the "light on" time. There is a variable extended delay modification in the "World Scanner Report", to large to duplicate here. Also, in Volume 1, Number 4, Bill Cheek reports that the UC-1147 CPU has the necessary large chunk of memory on board, so you're stuck with 200 channels. You can get the WSR from:

COMMtronics Engineering
PO Box 262478
San Diego, CA 92196

The Scanner Modification Handbook I and II are available from the same address. They're something like $17.95 each + $3 P&H. The WSR is $25 per year.

NOTE : I am not responsible for anything that goes wrong. Note that this

Newsgroups: alt.radio.scanner
From: interpol@casbah.acns.nwu.edu (Interpol)
Subject: Uniden Bearcat 200XLT Battery Indicator Modification
Message-ID: <1992Mar13.185815.15749@casbah.acns.nwu.edu>
Sender: interpol@nwu.edu
Organization: Northwestern University, Evanston, Illinois
Date: Fri, 13 Mar 1992 18:58:15 GMT
Lines: 161

Here's some mods to help remedy the 200XLT's low battery indicator/blank out feature, courtesy of Bob Parnass:

BC200XLT LOW BATTERY FIXES
Troy T. Pummill, N6XMV

Here are two small articles from MT. I have not tried these mods, do so at your own risk (i.e. your milage may vary).

From Monitoring Times
Bob's Tip of the Month
May 1990, page 98

BC200XLT SHORT BATTERY LIFE SOLVED

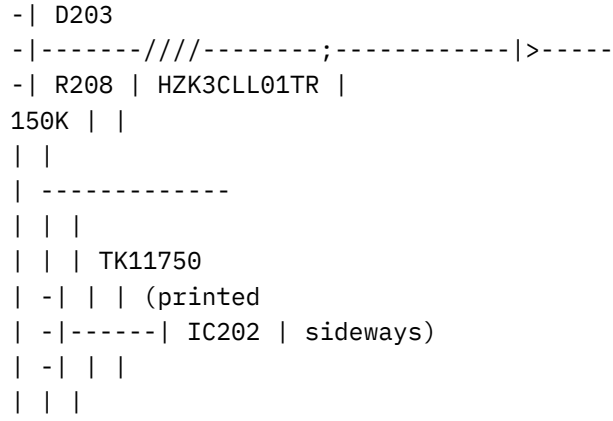
Short abttery life--sometime only an hour or two between charges--seems to be the only major complaint amoung owners of the laeading hand-held scanner, the Uniden Bearcat BC200XLT. Presumably, owners of similar sets like the BC100XLT BC205XLT, and Cobra 4030 could have the same problem. Now that is an ailment of the past.

It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor provides the answer.

FREE FIX

MT contacted Uniden and was assured that they will provide the fix for free, even if the radio is outside of the one-year warranty period. If your Uniden BC200XLT suffers from short battery life, send the radioo along with a brief note describing the ailment, to Uniden Customer Service, 9900 West Point Drive, Indianapolis, Indiana, 46250.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.



| | |
| ---
|
|
|

SHORT CUT

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The radio now operates uninterrupted until it blanks out when the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge the original diode with a 6.8K resistor, defeating the premature recharge signal, yet preventing the battery from too low a discharge.

From MT
June 1990, page 98
Bob's Tip of the Month

BC200XLT BATTERY LIFE EXTENSION: Part II

Every time we run a helpful hint on a popular product, someone find an even more helpful hint! This one disable the low battery cutoff circuit and adds several hours of operation to a single charge. Our lab unit was still going strong after seven hours straight! Uniden will provide the fix for free, but if you're in a hurry and don't mind voiding your warranty, read on!

NOTE: This modification should not be attempted by anyone unfamilier with small circuit oard components.

The tools: You will need a small Phillips screwdriver, fine-tip soldering iron and solder wicking braid.

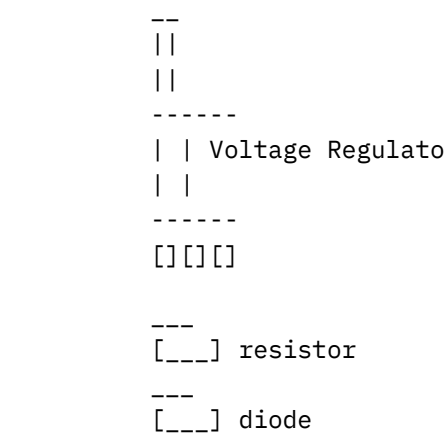
The procedure: Remove the battery pack, then the two screws form the bottom spring clip. Carefully pull the rear cover off, bottom first. Remove tjhe two small screws at the base of the circuit board. Pull the front panel away from the mainframe, bottom first.

At the bottom of the remaining board--to the left of the speaker magnet--are two blue electolytic capacitors; just above them are two striped components-- one resistor and one diode. Using the soldering iron and braid, carefully remove the two components without overheating the board or damaging the copper traces.

When you reassemble the radio, be very carful to note the insertion of the front panel into the slot at the base of

the volume/squelch panel. Be especially careful to align
the screw holes perfectly, allowing the two rows of fine pin
contacts to mate correctly with the socket. If this is not
done correctly (and it probably won't be the first time!) no
damage will occur, but the scanner display will be blank.

Recharge your batteries after 6-8 hours of heavy use. If
the scanner dies, recharge it as soon as possible to prevent
loss of your memorized frequencies.



==========

Newsgroups: alt.radio.scanner
From: interpol@casbah.acns.nwu.edu (Interpol)
Subject: Uniden Bearcat 200XLT Cellular Restoration Mod
Message-ID: <1992Mar13.190511.16655@casbah.acns.nwu.edu>
Sender: interpol@nwu.edu
Organization: Northwestern University, Evanston, Illinois

Date: Fri, 13 Mar 1992 19:05:11 GMT
Lines: 105

Yet another Uniden/Bearcat 200XLT modification, courtesy of Bob Parnass and other good people:

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. The modification will void your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.

2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.

3. Carefully pry the bottom of the rear cover from the radio and remove the cover.

4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.

5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.

6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration.

REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly (see step 7).

Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds, the frequency 845.000 should appear on the display.

Cut this resistor

Here's the last of the 200XLT mods I know of...downloaded off of a local BBS here in Chicago:

Modification for Putting BC-220XLT In AM Reception Mode

I have come up with a crude mod for the BC200xlt scanner to allow AM reception in the 136 to 174 range. Why would I want AM in this range you ask? well I attend several Air shows during the year and the Thunderbirds use 140 mhz area fregs. As we all know the Uniden switches to FM in this range, causeing very distorted reception (slope detection). Somebody else may have already thought of this idea (you?) but here goes. Break the AIR Trace between dual diode D31 and IC1 pin 8. Connect the center of a single pole - double throw mini switch to the trace leading back to IC1 pin 8. Connect one of the other poles to the trace leading back to D31. This is the "Normal" mode(This just restores what you have cut). Now connect the other pole to the VHI (VHF HI) line at a easy to locate point. This is the "AM" mode. What will happen now is when AM is selected the VHF and VHF air band will all be in the AM mode. UHF and others are not affected. When in the normal mode everything is just like it always was. I have done this mode over a year ago so it's still a cloudy in my memory. But it works like this: The microprocessor sends a high to Q7 to select the AIR mode, by routing the VHI signal around D31 by means of the switch the AM detector is reselected. Normaly D31 blocks out the VHI signal allowing FM in the VHF HI range. I hope my explaination of this mod is clear. It does take some delicate surgery to do. I also hope I haven't duplicated anyone elses idea.

Thanks

This is a polite way for the deputies to tell the dispatcher to
``kiss my ___''.

Actually, KMA is their callsign prefix. I've never understood why
they say just the prefix. I was a fireman down in Orange County -
the entire county communications system at that time was licensed
as KMA752 - that callsign was given every 30 minutes on every city
and county channel by Control One (better known as "Dogpatch" back
in those days).

use the same Frequency Commonly referred to as "Simplex"
PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Control etc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems
for "Input Scanning"
IFB Interruptible Feed/Fold Back. TV audio feed for reporters.

NOTES FOR OCTOBER:

AURORA 800:

On October 10th Simulcasting of the two dispatch groups and the Services Group on the old UHF radio system were discontinued. The Aurora Fire Department will continue to simulcast their dispatch group on 154.400 until completion of their new fire station signaling system.

DOUGLAS COUNTY FIRE:

The changeover for all of the agencies that are dispatched by the county is completed. To our knowledge all Douglas County Fire agencies except Parker and Louviers ares dispatched by the county on 151.115.

DENVER 800:

Same old same old. Intermittent crashes, consoles failing and four letter verbs over the air about system manager failures. Time to string up the equipment manufacturer in my opinion.

TANDY NEWS:

As if it were not commonly known Tandy Corporation [aka Radio Shack] had to pull all their 800 MHz scanners that were manufactured by uniden after the implementation of the TDDRA in April because of a factory test mode that included one of the Cellular frequencies announced the PRO-51 should be back in the stores this month. Tandy also released the PRO-2035 the 1000 channel successor to the PRO-2006. There have been mixed comments about the new scanner and complaints about the setup of 10 banks of 100 channels that lead to a lot of unused memory locations in cases where a bank is dedicated to a trunked radio system which will at the most use only 20 channels. Otherwise use for blocks of frequencies works well. For now anyway rampant word on the street is that Tandy will be trying to get a 400 channel triple conversion portable out by Christmas.

SEASONAL FREQUENCIES:

With the rapid approach of the winter season on us adding the highway maintenance frequencies can be very beneficial while traveling or on the way to and from work. The Colorado Department of Transportation frequencies are of value when traveling the interstate highways. Here is a listing of the CDOT frequencies used for the Front Range and Summit

County. 151.070, 151.085 for the Metro Area and I-70 Tunnel approaches. 151.265 for El Paso County. And 159.045 for Boulder, Larimer and Weld Counties. These frequencies are allocated statewide so these will be active in other areas of the state. For specific areas look under the area jurisdiction for which you are interested in with frequencies listed as street maintenance or city services.

CREDITS:

Somebody suggested I should do this more often so... Thanks go to Randy Lynch for being himself. Bill Koppleman for spreading the word on this and the echo on the Rocky Mountain Monitoring Net on 147.225 Sunday evenings at 8 P.M. Radar Kessler for the encouragement. Jim at Mountain NewsNet for information pertaining to the reorganized Douglas County Fire communications system and South Metro Fire communciations system. Marshall Barry and Bob Whiston for getting the echo mess fixed. The people who participate in the echo and who corner me in person. And finally you who are reading this and making it worth the effort!

5829. Coaxial cable help

Newsgroup: rec.radio.scanner
Date: 1995-06-30 00:00:00 UTC
From: mikef@anshar.shadow.net
Message-ID: <3t1li6$njl@anshar.shadow.net>
Source record: 253306

I am currently using rg8x in a 100ft run,would I gain any advantage by switching to RG6-U. I plan on using one antenna for two scanners and would like to keep the signal loss down to the minimum. I also plan on adding a Grove's Pre-5 to my antenna.

Thanks for any replies
Mike

5830. REQUEST: R7100 programming info.

Newsgroup: rec.radio.scanner
Date: 1995-06-30 00:00:00 UTC
From: "Norm Tyler (Jr.)" <ntyler@Intellistor.COM>
Message-ID: <Pine.SUN.3.90.950630150031.4021A-100000@opus>
Source record: 253307

I would appreciate it if someone could post (or email me) details on using the RS-232 interface on an R7100. I have the radio and hardware, but seem to have misplaced the manual. If anyone has source code or programs they are happy with, I would appreciate seeing these as well.

I apologize if this post is redundant, but the one I posted yesterday seems to have expired already :(

Thanks a BUNCH!!

5831. RE: PICKING UP ON CELLULA

Newsgroup: rec.radio.scanner
Date: 1995-06-30 00:00:00 UTC
From: bill.funk@iotp.com
Message-ID: <8AC42DA.059E0022DF.uuout@iotp.com>

DL> Is this bad to be picking up the images? After recent discusion on
DL> this, and af ter
DL> printing out a list of all the freq. I have programmed into my P39, I
DL> see now that I have around 23 that are above 894.

No, it's not bad at all. It just happens. It's a characteristic of
dual-conversion scanners to have images.

DL> Also, when comparing
DL> my number list to that which was posted for the input/output numbers, I
DL> hardly have any with in that range. For example. The output (according
DL> to the post the other day) should start at 870-879 and 880-894. Well,
DL> of the 75 or so freq that I hav e
DL> programed in, NONE fall in between those numbers. IN fact, none fall
DL> between the input side of the freq either. Except for those above 896,
DL> all of my numbers fall between 851 and 868.

DL> Can anybody explain this?

Your scanner will not tune to the cellular frequencies. However, you antenna
will still pick up cellular signals. Those signals are being heard as
images. An image is usually off the actual frequency by an amount equal to
twice the first IF frequency, either up or down depending on the design of
the scanner. Yours is obviously going up. Thus, the images you are receiving
are above the real frequencies by [1st IF X 2].
Does this help?

5832. airport talk...HELP!!

Newsgroup: rec.radio.scanner
Date: 1995-06-30 00:00:00 UTC
From: twilson3@ix.netcom.com
Message-ID: <3t1saf$4p9@ixnews3.ix.netcom.com>
Source record: 253309

Ive been listening to airport frequencies for about 5 months now and i listen to San Jose airport stuff, the tower frequency for san jose is 124.0000. When the airplanes take off, the tower tells them to switch from 124.0000 to bay departure which is 121.3000. Then the guy from bay departure says "Bay Departure, Radar contact." Can someone please tell me what "radar contact" means???

Oh yeah, if anyone also has a frequency list for all the airports in the Bay area(San Jose, Oakland, Moffit, etc...) can you please send me it thanks....

Why shouldn't I be listening to the 800 MHz band? That band includes public safety allocations from 821.0125 to 823.9875 and from 866.0125 to 868.9875. It also includes general radio services. As for cellular, if someone wants to broadcast their private telephone conversations over the public airwaves, they have no cause for complaint if other citizens listen in despite Big Brother's asinine, unenforceable, and generally ignored laws prohibiting such interceptions.

Probably because they're using a duplex system consisting of a high-power base transmitter (dispatcher) on one freq and low-power mobile transmitters in the cars on another freq.

Mr. Cooper spouts hateful bile by the gallon, but the minute a little acid is directed his way, he goes ballistic and tries to silence the source through specious threats of lawsuits. This demonstrates Mr. Cooper's real commitment to freedom of speech - a commitment clearly limited to himself and those who agree with his crackpot views.

Incidentally, Mr. Hauser might consider the implications of homosexuality in this post as being just as actionable as his crack about Mr. Cooper.

The chip is made by GRE! Typically you will not find custom chips in any IC book.
If you want a replacement, talk to Radio Shack. If you want info on it, get the 2006
service manual from Radio Shack.

-> departure says "Bay Departure, Radar contact." Can someone please tel
-> me what "radar contact" means???

"Radar Contact" means Oakland Center has the aircraft on their radar screen and the aircraft's transponder is working properly.

-> Oh yeah, if anyone also has a frequency list for all the airports in
-> the Bay area(San Jose, Oakland, Moffit, etc...) can you please send m

The list of all frequencies is quite extensive, because of the various airports involved. You'd be better off running down to the pilot shop at SJC or Reid Hillview and picking up the local TCA (Terminal Control Area) Chart or the FAA Airport Gide for No. CA. That will give you everything you want and more.

Ron

How do you know who was talking? Maybe the person indicating their location
was talking to a your next door neighbor, and your neighbor was using a
cordless phone. Or maybe they were both using cordless phones. The only way
to really get a good pos hit on someone is if they are ordering a pizza ,
because you know Domino's doesn't use cordless (and if they did you'd get hits
24 hours a day!)

[why I built a zapper deleted]

>Ken

Every 1/64 " you add to the antenna trace is a frequency increase of 50MHz, or so indicates my X-Band zapper book from Rainbow. If you added 3" to your antenna, you would add 9.6 GHz to your transmission freq, which is enough to shove X band to K band. I think Ka is a sub-set of K, but I couldn't find the radar sub-band breakouts anywhere. You may want to look at it on a spectrum analyzer and see where you really are.

Anyway, I tuned my zapper on an HP spectrum analyzer, and I had trouble tuning even using a razor because cutting only 1/64" is REAL hard. But I have a range in excess of a quarter mile! I don't own a radar detector, but I borrowed a Cobra Trapshooter for field testing.

Yesterday, I had to travel to Southern Maryland with two guys from work, one of whom has a lead foot and drives like a maniac. I carried both the (borrowed) radar detector and my Zapper on the plane, and we hooked up the detector in the car after we crossed the river from VA into MD. On the way back the driver was going 85 mph or so on Route 4 going into DC. I hit the zapper and that radar detector lit up like a Christmas tree! What a riot! He proabably put 10,000 miles wear on those brakes in five seconds! We all had a good laugh later in the USAir Club. Well, at least two of us did!

Happy Zapping,
dewayne

Yes, Tony, you can purchase a GRE SuperConverter 9001 from Grove at
1-800-438-8155 (~$100 incl. S&H) to enable the complete 800 - 900 MHz
band.
Hope that helps you some.
